Building Stemmas with the Computer in a Cladistic, Neo-Lachmannian, Way

The Case of Fourteen Text Versions of *Lanseloet van Denemerken*

Een wetenschappelijke proeve op het gebied van de Letteren

PROEFSCHRIFT

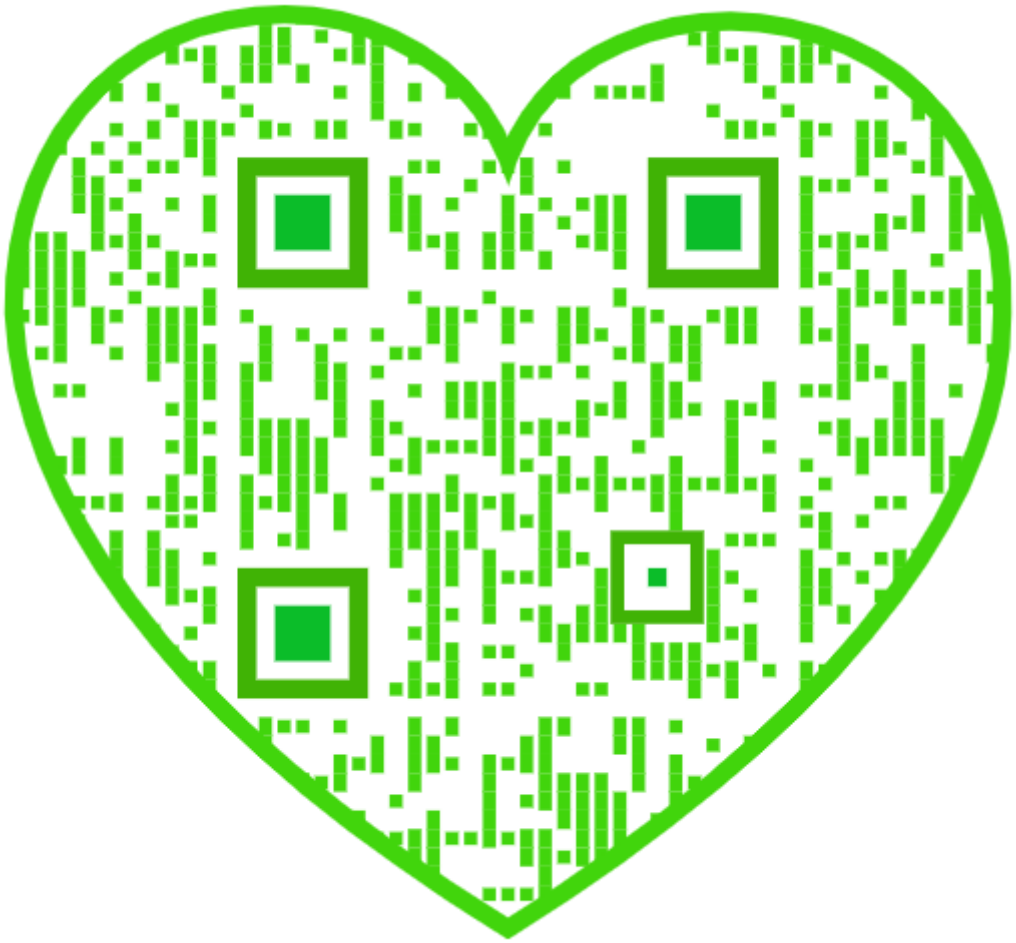
ter verkrijging van de graad van doctor
aan de Katholieke Universiteit Nijmegen,

volgens besluit van het College van Decanen
in het openbaar te verdedigen
op vrijdag 18 februari 2000

des namiddags om 1.30 uur precies

door
Benedictus Johannes Paulus Salemans

geboren op 10 december 1955 te Maastricht



Promotor: Prof. dr. G.R.W. Dibbets

Manuscriptcommissie: Prof. dr. E.M.P. van Gemert (KUN)
Prof. dr. Th.F.C. Mertens (UFSIA)
Prof. dr. P.Th. van Reenen (VU)

CONTENTS

ACKNOWLEDGEMENTS 1

1. INTRODUCTION: WHAT IS THIS BOOK ABOUT? 3

2. SOME CURRENT GENEALOGICAL METHODS 11
2.1. Introduction 11
2.2. A Stemma as a Historical Image and as a Tool for Text Reconstruction 12
2.3. Building a Stemma according to the (nineteenth-century) Method of Lachmann 18
2.4. Building a Chain and a Stemma according to the (twentieth-century) Method of Greg/Dearing 22
2.4.1. Introduction 22
2.4.2. Typology of Variations and their Notation 23
2.4.3. The Importance and the Limitation of Type-2 Variations; the Virtue of Type-1 Variations 25
2.4.4. Building a Chain with Type-2 Variations: Dearing's Rules for Building Chains with Transformed into a New Algorithm; the Notion 'End Group' 27
2.4.5. Orienting a Chain into a Stemma 31
2.5. Current Universal Taxonomical Principles, Biological Systematics and Cladistics 35
2.5.1. Taxonomical Ordering Strategies 35
2.5.2. Ordering or Clustering Taxons with Features 36
2.5.3. Systematics and Text Genealogy 40
2.5.4. Cladistics and the Principle of Parsimony 43
2.5.5. Demonstration of Building a Genealogical Tree with PAUP 43
2.6. Cladistic Implications for the Methods of Lachmann and Dearing 47
2.6.1. Reconsideration of the Lachmannian Notion 'Common Error' . . 47
2.6.1.1. Lachmann's/Maas's 'Common Error Rule' is Only Correct as Long as the Variants are Part of Type-2 Variations 47
2.6.1.2. The Problem of Building Chains from Complex, Non-Type-2 Variation Formulas like AB:CD:EF 49
2.6.1.3. The 'Zwei Zeugen' Element Reconsidered 52
2.6.2. A Cladistic Eye-opener for Lachmannians: Rooted and Unrooted Trees 54
2.6.3. Criticism of Dearing's Way of Additioning Variations 55
2.7. The Minimum Number of Three or Four Text Versions 57
2.8. A Simple Advice for the Study of Contamination 58
2.9. Conclusion and Summary 59

3. TOWARDS A NEW TEXT-GENEALOGICAL METHOD 61
3.1. Introduction 61
3.2. The Theoretical Framework: Six Basic Text-Genealogical Principles . . 64
3.2.1. The First Basic Principle; the Definition of a Text-Genealogical Variant; Parallelism and Contamination 64

3.2.2. The Second Basic Principle; the 'Positivistic' Apparatus of Text-Genealogical Variants; a Short Discussion about 'Objectivity' and Quentin's 'Non-Positivistic' *Zéro Caractéristique* 71
3.2.3. The Third Basic Principle; the Definition of a Variation Place 77
3.2.4. The Fourth Basic Principle; the Type-2 Limitation, Partly Dismantled with the Use of End Groups 78
3.2.5. The Fifth Basic Principle; the Text-Genealogical Use of Differences in Word Order; Additions and Omissions of Words or Verses 81
3.2.6. The Sixth Basic Principle; the Definition of Text-Genealogical Word Types 85
3.3. The Formalization: Rewriting the Theory in Eleven Characteristics of Text-Genealogical Variants; the Seventh Text-Genealogical Principle 90
3.3.1. The Eleven Characteristics of Text-Genealogical Variants 90
3.3.2. The Seventh Basic Principle of the (Temporary?) Role of the Philologist 103
3.4. The Implementation: Developing Software from the Formalized Theory 106
3.5. Conclusion and Summary 109

4. APPLICATION OF THE METHOD TO THE *LANSELOET VAN DENEMERKEN* CORPUS 113
4.1. Introduction 113
4.2. Short Description of Fourteen *Lanseloet van Denemerken* Text Versions and their Contents; Bibliographical Remarks 115
4.3. Demonstration of the Software Treating Verses of *Lanseloet van Denemerken* 121
4.4. First Computer Results: All the Detected Text-Genealogical *Lanseloet van Denemerken* Variants 133
4.4.1. Introduction: +Comb-formulas and Obs-formulas 133
4.4.2. The Obs-formulas 134
4.4.3. The +Comb-formulas concerning Characteristics 5 and 7d and the +Comb-formulas Not Rejected by any Characteristic 135
4.5. The Removal of Incorrect *Lanseloet van Denemerken* Variants by the Philologist, Applying Non-Automated Characteristics 141
4.6. Presentation of the Variation Formulas for Building the *Lanseloet van Denemerken* Chain 146
4.7. The Development and Presentation of the *Lanseloet van Denemerken* Chain with Use of Cladistics 151
4.7.1. First Attempt to Build the *Lanseloet van Denemerken* Chain; a Handmade Sketch of this Tree 151
4.7.2. Judgement of the Handmade Sketch of the *Lanseloet van Denemerken* Tree: No Contamination 154

4.7.3. Missing Values: Some Extra Variation Formulas are Needed; a Second Handmade Sketch of the *Lanseloet* Tree 155
4.7.4. The *Lanseloet van Denemerken* Tree as Developed by the Cladistic Software Package PAUP 172
4.7.4.1. Transforming the Variation Formulas into NEXUS format 172
4.7.4.2. Measuring Distances between Texts 173
4.7.4.3. The Chain of the *Lanseloet van Denemerken* Texts as Drawn by PAUP; the Trustworthiness of the Chain . . 174
4.8. The Development and Presentation of the *Lanseloet van Denemerken* Stemma 178
4.8.1. Introduction 178
4.8.2. Determination of the Point of Orientation 179
4.8.2.1. First Attempt to Find the Point of Orientation 180
4.8.2.2. Second Attempt to Find the Point of Orientation 192
4.8.3. Presentation of the Stemma of *Lanseloet van Denemerken* 195
4.9. Information Derived from the *Lanseloet van Denemerken* Stemma and Text Versions 196
4.10. Conclusion and Summary 199

5. EVALUATION OF THE *LANSELOET VAN DENEMERKEN* STEMMA AND THE TEXT-GENEALOGICAL CHARACTERISTICS 203
5.1. Introduction 203
5.2. Evaluation of the *Lanseloet van Denemerken* Stemma by Comparing it with *Lanseloet* Stemmas in Other Studies 204
5.2.1. The Part of the *Lanseloet* Stemma in Leendertz (1907) 204
5.2.2. The Part of the *Lanseloet* Stemma in Goossens (1973) 208
5.2.3. The Part of the *Lanseloet* Stemma in Goossens (1976) 216
5.2.4. The Part of the *Lanseloet* Stemma in Hüsken & Schaars (1984) 218
5.2.5. Results of the Comparison of Our Stemma with the Other *Lanseloet* Stemmas 222
5.3. Evaluation of the Text-Genealogical Characteristics 223
5.3.1. Evaluation of Characteristic 1 225
5.3.2. Evaluation of Characteristic 2 229
5.3.3. Evaluation of Characteristic 3 230
5.3.4. Evaluation of Characteristic 4 231
5.3.4.1. Evaluation of characteristic 4a 233
5.3.4.2. Evaluation of characteristic 4b 235
5.3.4.2.1. Evaluation of the Word Category Adjectives 235
5.3.4.2.2. An Alternative *Lanseloet* Stemma with Contaminated Texts 04 and 05? 237
5.3.4.2.3. Evaluation of the Word Category Adverbs . 240
5.3.4.2.4. Diachronical, Parallelistic Changes in Flexion/Casus from 1400 to 1700 244
5.3.4.2.5. Evaluation of the Word Category Articles . . 247

5.3.4.2.6. The Parallelistic Character of the Gender of Substantives 251
5.3.4.2.7. Evaluation of the Word Category Auxiliaries 252
5.3.4.2.8. Evaluation of the Word Category Conjunctions 257
5.3.4.2.9. Evaluation of the Word Category Prepositions 259
5.3.4.2.10. Evaluation of the Word Category Pronouns 260
5.3.4.2.11. Implications of the Evaluation of Characteristic 4b for the *Emendatio* 264
5.3.5. Evaluation of Characteristic 5 266
5.3.6. Evaluation of Characteristic 6 267
5.3.6.1. Evaluation of Characteristic 6a, concerning Small Differences 267
5.3.6.2. Evaluation of Characteristic 6b, concerning Word Boundaries 270
5.3.6.3. Evaluation of Characteristic 6c, concerning Nonsense Words, Slips of the Pen or Typographical Mistakes . . 271
5.3.7. Evaluation of Characteristic 7 272
5.3.7.1. Evaluation of Characteristic 7a, concerning Inflection . 273
5.3.7.2. Evaluation of Characteristic 7b, concerning Differences in Vowels 274
5.3.7.3. Evaluation of Characteristic 7c, concerning (Personal) Vocabularies 275
5.3.7.4. Evaluation of Characteristic 7d, concerning Frequently Used Words and Names 277
5.3.8. Evaluation of Characteristic 8 278
5.3.9. Evaluation of Characteristic 9 281
5.3.9.1. Evaluation of Characteristic 9a, concerning Rhyming Conventions 281
5.3.9.2. Evaluation of Characteristic 9b, concerning Duplicate Rhyming Words 284
5.3.10. Evaluation of Characteristic 10 286
5.3.11. Evaluation of Characteristic 11 287
5.3.11.1. Evaluation of Characteristic 11a, concerning Added or Missing Words 287
5.3.11.2. Evaluation of Characteristic 11b, concerning Added or Missing Verses 294
5.3.12. Summary of the Evaluation of the Characteristics 296
5.4. Conclusion and Summary 297

6. FINAL REMARKS 299

ACKNOWLEDGEMENTS

First of all, I would like to thank Prof. Dr. Jan van Bakel (University of Nijmegen) for his impressive and inspiring lectures and scientific lessons. My promotor Prof. Dr. Geert Dibbets (University of Nijmegen) taught me the first principles of editing old texts. I admire him for his wisdom and his patience with me. I will always be grateful to Prof. Dr. Piet Buijnsters (University of Nijmegen) for sharing his immense knowledge and appreciation of old books. Dr. Paul Wackers (University of Nijmegen) opened up my heart to the beauty of medieval literature.

Dr. Willem Ellis (University of Amsterdam), a biologist, was always willing to answer my 'stupid' questions about biological ordering methods. Prof. Dr. Thom Mertens (Ruusbroec-genootschap in Antwerp) and Dr. Ton Duinhoven (University of Amsterdam) were always prepared to criticize preliminary versions of my papers about text-genealogical matters, including this book. I discussed many stemmatology matters under pleasant conditions with Prof. Dr. Pieter van Reenen (Free University of Amsterdam) and 'his' group of Dutch text-genealogists, amongst which the kind and wise mathematician Dr. Evert Wattel (Free University of Amsterdam) and the Dutch text-genealogical pioneer Prof. Dr. Ton Dees. I thank Prof. Dr. Vittore Branca (University of Padova) for sharing his wise insights with me during my stay in Rome in May 1998, when I was invited to give a lecture on automated textual criticism at the Accademia Nazionale Dei Lincei. I am also greatful for the heartening support of Prof. Dr. R. Hauer (University of Utrecht), Dr. D. Hertzberger (Nijmegen) and Dr. L. Bellersen (University of Nijmegen).

Three friends followed my research and life closely with much patience. Dr. Peter-Arno Coppen (University of Nijmegen) helped me to keep a general methodological overview of my research, which started in 1985. Dr. Margot van Mulken (University of Nijmegen) and I discussed during many days, evenings and even nights, the fundamentals of text-genealogical research and life, often in 'our' Nijmegen pub 't Haantje. Thank you, Margot, for these very pleasant, inspiring and encouraging hours. Dr. Willem Kuiper (University of Amsterdam) was always willing to lend me an ear concerning stemmatological or private affairs, no matter what time it was; a true friend.

I am also greatful for the friendship of the editors of Neder-L, the free electronic Internet-magazine about Dutch language and literature, which I started in 1992 (URL: http://baserv.uci.kun.nl/~salemans/). Besides the already mentioned Willem Kuiper and Peter-Arno Coppen, the editors are Dr. Piet Verkruijsse (University of Amsterdam) and Prof. Dr. Marc van Oostendorp (Meertens Institute and University of Amsterdam).

I thank Maastricht for just being there. The same goes for its football club MVV. Thank you, Willy Brokamp, Jo Bonfrère and Erik Meijer. I thank Bob Dylan, Green Day, Paul McCartney and Wolfgang A. Mozart for their music.

It is good to know that in hard times some friends stay around. Roland de Bonth, Patrick Leijzer, Frans Schaars, Hans and Conny Schoonbrood, Peep Stalmeijer and Remy Wolfs, thank you.

The most important people for me are my children Bart, Milou and Joost. I could have dedicated this book to you, but that would have sounded like a cheap excuse for not being around.

Finally, I would like to thank my parents Bart, already in heaven, and Marie-Therèse, and my five siblings and their partners for their unconditional support; respectively Mariëtte (and Roel), Thom (and Marij), Frank (and Beppy), Cintha (and Jos) and Eugénie (and Pierre). I dedicate this book to my twin brother Frank, with whom I have a very special bond.

Shortly after my supervisor prof. dr. G.R.W. Dibbets had approved of my dissertation, dr. G.A. van Thienen of the Royal Library in The Hague reported in *Neder-L* 9911.16 (URL/Internet Address: http://baserv.uci.kun.nl/~salemans/bulletin/1999/11/991116.html) that the Royal Library recently bought fragments of a *Lanseloet van Denemerken* text version, so far unknown. A short study into these fragments, together 126 verses, proved to me that it was indeed a new version. In the near future, I hope to publish an article in *Neder-L* about this fifteenth *Lanseloet* text version and its place in the *Lanseloet van Denemerken* stemma.

1. INTRODUCTION: WHAT IS THIS BOOK ABOUT?

In the Middle Ages copyists transcribed texts by hand. During the laborious transcription process they introduced - intentionally or unintentionally - errors and other new, unoriginal elements in the copy texts they were producing. If these new texts were copied again, new errors could be introduced, etc. The invention of the printing press around 1450 did not change this process much. After all, book printers (type-setters, bookbinders) introduced unoriginal elements in their works as well. The general result of copying texts was that after a time several different versions of one original text existed, while the original text was lost.

Philologists of all ages, even before Christ, saw themselves confronted with the problem how to remove these unoriginal elements from the existing texts.

Before 1700, textual criticism, the art of reconstructing old lost texts, was not very systematic. This can be demonstrated by the first printed version of the Greek New Testament. The first complete edition of the Greek New Testament was produced by Erasmus of Rotterdam. It was printed in 1516 on Froben's presses in Basel. For centuries it has been accepted as the ultimate Greek New Testament (NT) text: the *Textus receptus*. Erasmus developed the Greek NT from a few (fragmented) Greek NT versions which were present in Basel and its neighbourhood. He selected the 'best' parts of them rather arbitrarily - he simply chose the parts which he judged, on the basis of his taste, to be original - and glued them together into one book. To fill the missing parts, he even used Latin sources, which he translated into Greek.

In the eighteenth century, philologists like Bengel, Bentley, Griesbach, Mill and Wettstein[1] started to fight the authority of the *textus receptus*. However, they did not succeed in developing methods with which original and unoriginal elements in text versions could be detected.

Professor Karl Lachmann demonstrated in 1830 that Erasmus's Greek NT was composed incorrectly. He proposed a new text-critical method, known as the *method of Lachmann*.

This nineteenth-century Method will be discussed in detail in §2.3. At this point, I will give a concise introduction. The heart of the method of Lachmann is that we must know the relationships of text versions, before we start to correct (or *emend*) unoriginal parts in them. In short, it is a method in two steps: first, in the *recensio* phase, a pedigree or *stemma* of the text versions must be developed; second, in the *emendatio* phase, (un)original elements in these texts can be detected with the use of the stemma.

How can a stemma be developed during the *recensio* phase in a Lachmannian way? The basic Lachmannian thought is sound and simple. If a serious error is introduced into a text version - e.g. a couple of verses are missing -, it is likely that the descendants of that text version will show the same *common error*. It is

---

[1] More thorough information about the history of textual criticism and text-critical philologists like Bengel, Bentley, Erasmus, Griesbach, Lachmann, Mill and Wettstein can be found in Aland & Aland (1971), Kenney (1974) and Timpanaro (1971).

assumed that all the texts with the missing couple of verses go back to the same common ancestor in which this error occurred for the first time. Once we have detected more common errors, we will be able to draw the stemma or pedigree. One can compare this with a kind of unique disease or DNA sequence which is passed on from the father or mother to the children and their children, etc. The occurrence of the disease, or DNA sequence, may serve as a guide to find genealogical family relationships. Likewise, if one can find common errors in text versions, the family pattern or relationships between the text versions will become clear and the stemma can be produced.

Imagine that we have six text versions: text ‘A’, ‘B’, ‘C’, ‘D’, ‘E’ and ‘F’. Suppose that in certain text passages one or more common errors in text ‘A’ and ‘B’ have been detected, while the other text versions ‘C’ to ‘F’ have other words (*readings*) in common, different from the common errors. Then we may conclude that both texts ‘A’ and ‘B’ have a common forefather, in which the errors first showed up. We label this (lost) *common ancestor* of both texts as ‘a’. Text ‘a’ cannot have been the forefather of, for instance, text C, because we assume that one or more common errors present in A and B do not occur in C. In the same line of thought, suppose that unique common errors are present in texts ‘C’ and ‘D’ (leading to common ancestor ‘b’), and others pop up in texts ‘E’ and ‘F’ (leading to ‘c’). Furthermore, ‘C’, ‘D’, ‘E’ and ‘F’ have common errors, which gives rise to the thought that these four texts must share a common forefather ‘d’. We assume that the six texts go back to one common original text: text ‘O’. All these common errors lead to the next stemma, as an end result of the *recensio*:

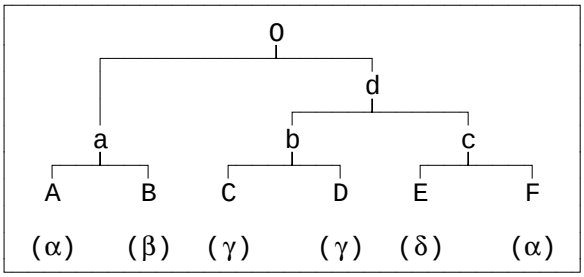

Figure 1. Example of a stemma.

How can we use this stemma, the genealogical pattern, as a tool for text reconstruction? The stemma is used for that purpose during the second phase: the *emendatio*. Suppose that the first line of text A starts with ‘α’; at the same place B has ‘β’, C and D read ‘γ’, E starts with ‘δ’, and F has ‘α’. In other words, we have four different variants (i.e. different words or readings): ‘α’ appears in two texts, ‘β’ in one text, ‘γ’ in two texts, and ‘δ’ in one text. These variants are presented at the bottom of fig. 1. When we look at variant ‘γ’, we see that it is present in texts C and D. Therefore, it is likely that the common ancestor of C and D, text b, must have had variant ‘γ’ as well. Now we look at variant ‘α’, which occurs in A and F. The (first) common ancestor of both texts is O, the lost

original text. According to the method of Lachmann we can assume that the lost original text had the reading ‘α’. In this way we have been able to reconstruct a part of the lost original text with the use of the stemma. (Later on, in §5.3.4.2.11, this sketch of the *emendatio* phase will be criticized.)

As we will see in §2.4, the method of Lachmann has been criticized because it is hard to detect common errors in a scientific (= verifiable / repeatable), way. It is unclear how it can be determined that a variant is an (unoriginal) error. The Lachmannian way of determining errors was based upon subjective judgements of variants beyond scientific control. Furthermore, its (vague) principles were not performed consequentially or consistently. Sometimes, for instance, differences in word order are used as common errors; sometimes they are not; therefore, Lachmannian judgements about the originality of variants often have an ad hoc character.

As will be discussed in the same section (§2.4), twentieth-century philologists like Greg (1927), Quentin (1926), Dearing (1974) and Dees (1975) proposed an alternative, better approach. They demonstrate that a stemma can be built in two steps. First, these modern text-genealogists develop a deep-structure of the stemma, the so-called chain, using variants that do not have to be judged as to their originality. Second, they produce a stemma from the chain. The advantage of this modern two-step method will be clear: the judgement about the originality of the variants is less important.

Often, modern philologists use type-2 variations to build their chains. We speak of a type-2 variation, if at a certain place in the text versions precisely two variants occur and if each variant is present in at least two text versions. Generally, I am convinced that complex variations, with three or more competitive variants, are almost useless for the development of chains and stemmas. In other words, I think that philologists should in general only work with the mentioned special type of variance. This severe limitation is called the *type-2 limitation.*

What is this dissertation about and which are its merits?

In the first place, this dissertation offers a global introduction to stemmatology, the art of building text-genealogical trees. It gives an introduction to and a critical overview of several existing methods of building text-genealogical trees, the so-called chains and stemmas. In discussing these methods, we will see that it will be sometimes necessary to adapt basic notions of these methods. Of course I do not intend to give away all the results of my research in this introduction, but in §2.6.1 it will be demonstrated, for instance, that the Lachmannian *common errors* may be used only under very special conditions (namely in a so-called ‘type-2 environment’). In this book, current text-genealogical methods will be compared and a new method of building trees will be established.

Secondly, this study is interdisciplinary. In this dissertation, we will have a look at the way biologists build their genealogies for animals and plants. From this outsiders view we hope to get a clearer picture of strenghts and weaknesses of several textual-stemmatological methods. In §2.5 we will introduce cladistics, currently one of the leading biological ordering methods. The core of cladistics is the permanent question which elements or characteristics in a species can be used to develop genealogies. The simple lesson taught by cladistics is that we must be very careful in using characteristics for genealogical research. For example, the fact that both swallows and flies have wings, does not imply that these birds and insects belong to the same family. The characteristic 'having wings' is not a trustworthy genealogical informant. Again, text-genealogists can learn from cladistics that they must be very careful in choosing variants to be the building stones of chains and stemmas.

Thirdly, two hot items in current textual stemmatology will be discussed: in §2.8 the problem of contamination and in §2.6.3 the type-2 limitation.

Normally a text version is a copy of one other text version. It is, however, possible that a text version X is produced from two or more texts Y and Z, for instance, because text Y was incomplete or because text Y was considered to contain incorrect passages. X is then a bastard text or a contaminated text. It may show, almost unpredictably, contradicting variants pointing to a descendance from different families. Contamination causes 'bias' and hinders the development of chains and stemmas. In §2.8 a simple advice will be given to text-genealogists confronted with contamination.

The type-2 limitation is a strict limitation, since it prescribes the use of only special variants. We can derive text-genealogical information from these variants only if the text versions show precisely two variants, each present in two or more texts. This implies that more complex situations, for instance with three or four different variants, are useless for the development of text-genealogical trees. Dearing (1974) claimed that a solution to break this severe type-2 limitation was present. He developed a set of mathematical rules which enable us to derive (type-2) information from these complex situations. I still do not intend to give away all the results of my research in this introduction, but in this dissertation, Dearing's approach will be falsified. Dearing's stemmatological ideas have been quite influential. They have been used, for instance, in the development of parts the stemma of the Bible. By using Dearing's approach, parts of the original Bible text have been reconstructed in a possibly incorrect way.

Fourthly, this book does not concentrate on the *emendatio*, but on the *recensio*, the art of building chains and stemmas. As an example, the stemma of the fourteen versions of the medieval drama text *Lanseloet van Denemerken* will be produced. I stress that no emending attempts will be undertaken to restore or reconstruct (fragments of) the lost *Lanseloet* original. My reason for not

performing *emendatio* activities is simple. If we consider the classical Latin and Greek languages as dead, non-altering languages, it may be possible to restore an original text from around the year 100 on the basis of younger copies dating from around 1200. We assume that a classical Greek word in a text from the year 1200 looked the same in the year 100. A universally accepted standard Dutch language did not exist in the Middle Ages or the Renaissance. In the Low Countries, several dialects were spoken and written, which evolved in the course of time; these dialects were not dead. Therefore, it is quite dangerous to restore the lost *Lanseloet* text on the basis of the existing younger copies. We simply cannot be sure what a seventeenth-century word looked like in the original text from, say, the twelfth century. We do not even know the dialect of the original. This does not make the *Lanseloet* stemma worthless for text-critical purposes. It may still allow us, for instance, to reconstruct more abstract themes, subjects, etc., in the original *Lanseloet van Denemerken* text.

Fifthly, this book will discuss differences between inductive and deductive text-genealogical research. Roughly speaking, we can say that science is either inductive or deductive. As we know, in inductionism the observation of (objective) facts is the basis for the development of theories. Often, mathematical-statistical (inductive) techniques and computer programs are helpful in deriving knowledge from facts. Deductionism is based on (subjective) hypotheses, which are compared to observed facts. The facts may show that the hypotheses are incorrect, in which case the hypotheses are falsified or need to be adptated. If the facts are totally in agreement with the hypotheses, we say that the hypotheses are *confirmed* - not *proved*. The theoretical ideas in this book are hypotheses. They cannot be proved; they can only be falsified or confirmed. Logically, the correctness of the *Lanseloet* pedigree in this book cannot be proved neither; the tree is the result of the (automated) application of the hypotheses.

In §3.2.2 we will discuss the opposition of inductive and deductive science. In the last decades a still growing number of scientists within the humanities seem to adhere to the law of objectivism. Their credo seems to be: ‘science must be objective; knowledge must be derived in an objective way from objective facts; subjective science is a *contradictio in terminis*’. This dominant philosophy, this paradigm of objectivism, has lead (too) often to a rejection of subjective thoughts and hypotheses, because they supposedly have an unscientific aura.

Subjectivity, however, is not unscientific by definition. One fundamental of scientific research is that a scientist must show precisely what he or she is doing. Subjective ideas must be expressed in such way that they can be understood and criticized by other scientists; additionally, other scientists must be able to verify (and repeat) the procedures described by these subjective ideas. Once these ideas have met these criteria, they cease to belong to one person; they become *intersubjective* and scientifically acceptable. Anyway, science is, in my view, not

about objective measurement of facts; it lies in the interpretation of the outcome thereof. Therefore, science is necessarily intersubjective.

So far, we saw that this study covers five themes: 1. it offers a global introduction to stemmatology; 2. it is interdisciplinary and pays attention to biological-cladistic genealogical concepts; 3. it discusses hot text-genealogical items like contamination and the type-2 limitation; 4. it is concentrated on the *recensio*, not on emending text passages; 5. it pays attention to differences between deductive and inductive text-genealogical research. These five themes are the environment in which the main subject of this book is discussed: my method to build text-genealogical trees, which I call *automated deductive stemmatology*. Automated deductive stemmatology is a new text-genealogical approach, in which the computer is used to perform and test a set of (subjective) deductive hypotheses to recognize textual variants, with which trustworthy text-genealogical trees can be built. This subject covers the largest part of the book: in chapter 3 the basic text-genealogical principles and characteristics are explained and developed, in chapter 4 they are applied and in chapter 5 they are evaluated.

Before sketching what automated deductive stemmatology is about, I want to make a sidestep to describe my motivation for developing a deductive method.

In retrospect, I realize that this motivation grew out of three overlapping periods in my research.

First, when I started my text-genealogical research, I was fascinated by one fundamental question: why do stemmatologists claim that text-historical trees can be built with all kinds of textual variants? I understood how Lachmannians used their specially selected common errors, most often quite eye-catching variants, as hereditary scars passed on to the descendants. Once we have found these scars we can determine the text-historical relationships between the text versions. Unfortunately, the Lachmannian selection of common errors was not clear and repeatable, which made it unscientific.

The second phase started when I was studying current, modern alternatives for the method of Lachmann. I was, and still am, surprised by the easy, nonchalant way in which modern inductive stemmatologists use variants. Often the status of variants, the textual differences, seems to have become unimportant to them. They simply consider each textual difference as an objective, easily observable (objective) fact, although they sometimes exclude small or unimportant variants for unexplained reasons. They gather these objective facts and introduce them in statistical-mathematical software which builds, in an objective way, a tree out of them. But is such a tree a chain or a stemma, a text-historical tree?

In inductive research, the objective facts must be related to the goal of the research. If I want, for example, to predict the weather, I can gather all kinds of objective facts in and around my house: paperclips, stones, papers, etc. It is obvious that I will not be able to predict the weather with these facts, even though

they are *objective*. In other words, a goal-oriented justification is necessary for the selection of objective facts in inductive research. I dare to say that, until now, a scientifically necessary justification for the use of all the variants as building stones for historical trees has not been presented in inductive stemmatology. Some inductive, statistical stemmatologists admit that their trees are not historical trees, but trees which show the spread of the variants in the text versions. In that case, I simply do not see the virtue of such trees.

The third phase began when I became acquainted with biological cladistics. Cladists warn us that we must always ask ourselves whether a characteristic (in our case a variant) has the power to reveal the historical relationship of animals or plants. Only a very few characteristics have this relationship-revealing power. Cladists are convinced that a single convincing characteristic can provide more trustworthy information about the historical relationship than a thousand vague characteristics. They warn their inductive-statistical colleagues that statistical techniques like the *Law of great numbers* can filter out important characteristics.

The three phases taught me that my first question, about how text-genealogical trees can and should be built, was still unanswered. As we saw, the answer to this question is not only important for deductive stemmatologists, such as myself, but also for statistical-mathematical, inductive stemmatologists. They are obligated to justify their choice of variants as well. In other words, the answer to ‘my’ first question is relevant to both deductive and inductive stemmatology. We can even say that it connects both camps; both deductionists and inductionists must explain why they use (certain) variants as building blocks for their text-genealogical trees.

In chapter 3, I will sketch in global terms some fundamental principles or hypotheses about stemmatology. These hypotheses should not to be seen as a well-balanced model, but rather as a theoretical framework with which a proper model for the detection of text-genealogical building blocks should be developed.

Text-genealogical variants are differences in text versions that can be used to develop chains and stemmas. Later in chapter 3, I will derive concrete (sub)characteristics of text-genealogical variants from the hypotheses. This derivation is called the formalization process. While the hypotheses of the theoretical framework have an open or vague character, the characteristics derived from them are concrete, and can be applied to detect text-genealogical variants in the *Lanseloet* corpus. The set of text-genealogical characteristics can be seen as my method or theory to find text-genealogical variants to develop the *Lanseloet* tree with.

Also in chapter 3, I will explain how these characteristics can be transformed into computer software. This transformation from the theory into software is called the implementation process. As we saw, the nineteenth-century method of Lachmann has been criticized, because its detection of common errors was not verifiable or repeatable. Furthermore, the method of Lachmann has an ad hoc character, because certain detection principles are not applied consistently and persistently to all the variants. Logically, I wanted the application of my

characteristics to the *Lanseloet* texts to be scientific: verifiable, repeatable and consistent or persistent. In order to meet these criteria, I chose to let the computer to perform the characteristics, because it is an excellent apparatus to execute complex instructions rigourously, precisely and quickly.

In chapter 4, the fourteen *Lanseloet van Denemerken* texts will be entered into the computer software that I wrote in the computer language SNOBOL/Spitbol. As far as I know, this was the first time that a computer was able to analyse texts according to a deductive text-genealogical theory. The scientific advantages of the computer as analysis instrument is evident. Once the theory (the characteristics of variants) has been programmed into the computer it is repeatable, it will be performed consistently and it can be checked afterwards. The main advantage of letting the computer perform a theory is that we can be sure that, in our *Lanseloet* case, it will apply all the programmed characteristics to all the ten thousands of variants consequently and quickly. It is almost impossible to treat such a large amount of variants by hand without making mistakes. The automation of the procedure to detect the variants to build a text-genealogical tree with, is also important for inductive text-genealogists, because they usually work with variants which are classified by hand. The computer output, specifically the *Lanseloet* text versions plus the computer-generated variation formulas built with the automated characteristics, is too large to be printed as an Appendix on paper. Therefore, I put it on the cd-rom. However, parts of the output of Appendix C are offered in in this book (see the ‘List of Pictured *Lanseloet* Verses’ on p. 348).

All variation formulas (dealing with precisely two competitive variants) will be ordered by the computer. They are presented in Appendix D on the cd-rom. Many two-variant formulas will be rejected by the computer because the variants concerned are not in accordance with one or more automated characteristics. We will only use the two-variant formulas that are in total agreement with all the characteristics. These formulas are presented in §4.4 to §4.7.

Using the formulas, the chain of *Lanseloet van Denemerken* will be produced in two separate ways: by hand, using a simple algorithm explained in §2.4.4, and with the cladistic software package PAUP. Eventually, the *Lanseloet* stemma will be derived from the chain.

In chapter 5, the stemma and the characteristics will be evaluated. We will compare the tree with the *Lanseloet* stemmas developed by other researchers. We will also investigate whether the chain and stemma are trustworthy and whether the characteristics can be confirmed, rejected or adapted.

In the future, we can investigate if and how the text-genealogical characteristics can be applied to other texts as well. Notice, that the characteristics in this book are developed for the *Lanseloet van Denemerken* text versions (and other Middle Dutch texts). Undoubtedly, some characteristics will have to be reconsidered or reformulated before they can be applied to texts in other languages.

2. SOME CURRENT GENEALOGICAL METHODS

2.1. INTRODUCTION

Generally, *textual criticism* aims to restore a lost original text based on younger (handwritten or printed) copies of the text. As a tool for text reconstruction, a genealogy or stemma of the exististing text copies is indispensable; it displays the mutual relationship between the texts and can be used to trace original text elements.

In the last centuries several methods of building stemmas have been developed. One important theoretical study on text genealogy is W. Greg's *Calculus of Variants* (1927). In this standard work, Greg formulated some fundamental mathematical rules by which stemmas can be built. V. Dearing elaborated Greg's *Calculus of variants* in his famous *Principles and Practice of Textual Analysis* (1974). Both Greg and Dearing stated that there are several types of textual variation. Variation is the phenomenon that different versions of one text show different readings at certain places in the text. Greg claimed that only so-called type-2 variations give direct information about the shape (or chain) of a stemma: '(..) it will be apparent that it is only such variation as we see in type 2 that is fundamentally significant' (Greg 1927:23). This type of variation occurs when text versions show, at the same place in a text, precisely two competitive *variant readings* and when each variant reading (or variant) is represented in at least two text versions. Working with type-2 variations implies that four or more text versions are needed. Both Dearing and Greg prefered to work with type-2 variations. Additionally, Dearing developed an algorithm which adds up other types of variation formulas. The result is sometimes that new, extra type-2 variation formulas are created. This makes Dearing's method of dealing with variants more powerful than Greg's, since it accepts more types of variation as source of information to construct a chain. However, at the end of this chapter we will see that *Dearing's method of adding up type-3 and type-4 variation formulas, which results in new type-2 formulas, is not adequate*. In §3.2.2, we will also study an alternative method for building text-genealogical trees with, Quentin's *zéro caractéristique* method.

In chapter 2, some current text-genealogical methods will be discussed and explained for the reader who is unfamiliar with text-genealogical methods. As such, it offers a rough introduction to the world of Greg and Dearing. Necessarily we will examine the *method of Lachmann* (also known as: *the common error method*), one of the oldest ways of generating stemmas. It works with so-called *common errors*: text versions which show the same common error go back to the same ancestral text. We will see that this is correct only under special circumstances (namely in the case of type-2 variations). Therefore, we will formulate a *more accurate definition of the common error*. A point of criticism by *Bédier*, one of the firmest opponents of text-genealogical methods, we will discuss as well.

Biologists have ordered plants and animals into genealogies for centuries. It is possible that their ordering methods contain eye-openers for text-genealogists. That is why we will also examine current biological tree-building methods. We will see that the (biological) *cladistic* method does offer several interesting insights, which will be incorporated into this study. We will see that the cladistic software package PAUP can be used successfully in our text-genealogical fields.

2.2. A STEMMA AS A HISTORICAL IMAGE AND AS A TOOL FOR TEXT RECONSTRUCTION

In this study we consider an *original text* to be the text which the author meant to put on paper (or vellum, etc.).[2] Everyone, who has ever copied a text, knows how hard it is to copy it without making mistakes; textual differences, *variants*, are introduced into the copy. This results in an inadequate text copy, which we call the *text version*. The more often a text is copied the greater the number of non-original, deviant text versions. When we want to study a medieval text, we are very often confronted with the problem that the original text has been lost, while younger, varying, versions still exist. The absence of the original version challenges us to reconstruct it based on the younger versions. Like archaeologists and palaeontologists, we try to rebuild or give an impression of an original form by using its relics which are present in the existing text versions.

The first step in text reconstruction is the determination of the genealogical interdependence of the versions, which is usually presented in a genealogical tree or *stemma*. In §2.3 and §2.4, we will see how stemmas can be constructed. Now, in the current section, we will concentrate on the way a stemma is used as a tool to reconstruct a lost original. To illustrate this, we use the stemma in fig. 2.

That stemma is a fake stemma, only drawn for explanatory purposes. In this tree, which must be read top-to-bottom,[3] 'lost O-900' at the top represents the lost original text, which we are trying to reconstruct. 'Lost O' was produced in the year 900 A.D. The lines in the stemma are the *lines of descent*. The (arbitrarily chosen) characters A, B, C, D, E & F at the end of these lines of

---

[2] See Salemans & de Bonth 1990-91:212-215. The definition of the *original text* says that it is the text which the author *meant* to put on paper. It does not say that it was the *autograph*, the text which was actually put down on the paper by the author. In other words, according to this definition the original text never existed on paper. According to this view, the author is considered to be a copyist of the book in his head. While copying his imaginary book, he can make errors, just like any other copyist. Logically, the autograph may contain errors. It is impossible to reconstruct a perfect original text if it contains errors or imperfections. Ergo, if we assume that the original text did not contain errors, it must refer to the perfect text in the head of the author.

[3] Biological stemmas are presented in the opposite way: the original species stands at the bottom, while the derived species are presented above the original; the *root* of the tree is presented at the bottom.

descent are called *sigla* or *sigles*. These shorthand symbols represent the known, preserved text versions which were produced in respectively 1200, 1100, 1400, 1000, 1000 and 1500 A.D. For the sake of better historical insight, the sigla and the corresponding dates are linked here, which results in A-1200, B-1100,[4] etc. We call A-1200, B-1100, C-1400, D-1000, E-1000 and F-1500 *end nodes*, because no other (existing) text versions are copied from them. They are always attached to the end of a line of descent and no other branches sprout from them. The numbers 1, 2, 3 and 4 on the lines of descent in the stemma are codes for other lost text versions. These nodes are also known as *intermediates* or *intermediate nodes*. They are not attached to the end of a line of descent; one or more branches may sprout from them. In fig. 2 under each siglum of a preserved text version, three lines are added, all starting with the numbers 1, 2 and 3. These lines (with rather unlikely contents) represent the first three lines of each version. The *archetypus* is the hypothetical common ancestor of the existing text versions, which are in this case A to F. In fig. 2, the archetypus is an intermediate as well. We will discuss the status of the archetypus at the end of the current section. The length of the lines of connection (or *branches*) in this stemma express the age of the texts. Text version F was produced in 1500, and therefore, the length of its branch is longer than the branch length of text version B from 1100. In most stemmas (also the other stemmas in this dissertation) the length of the branches is rather arbitrary and does not provide information about the ages of the texts. (I repeat that we discuss the creation of the stemma of fig. 2 in §2.3 and §2.4).)

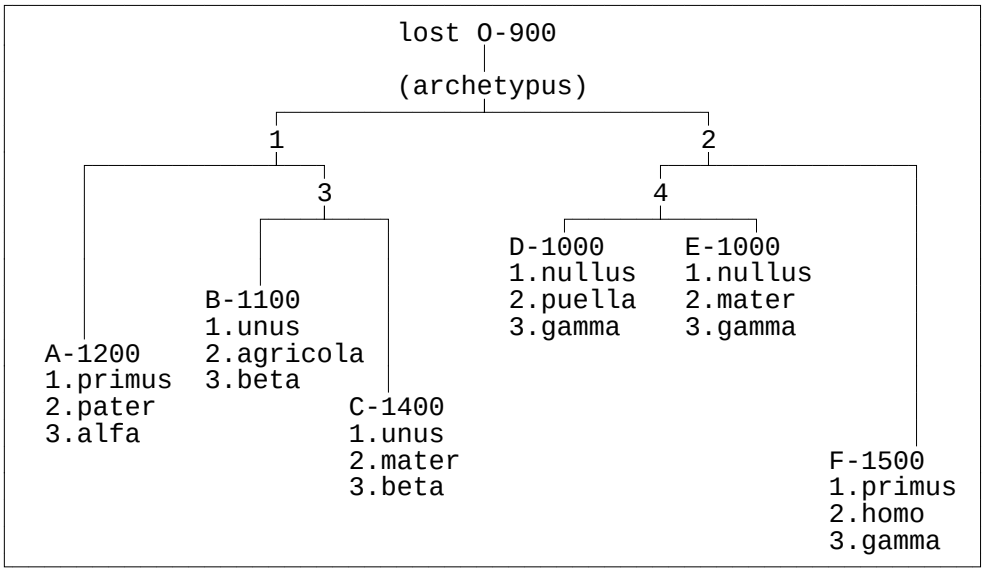

Figure 2. A stemma as a historical image and as a tool for text reconstruction.

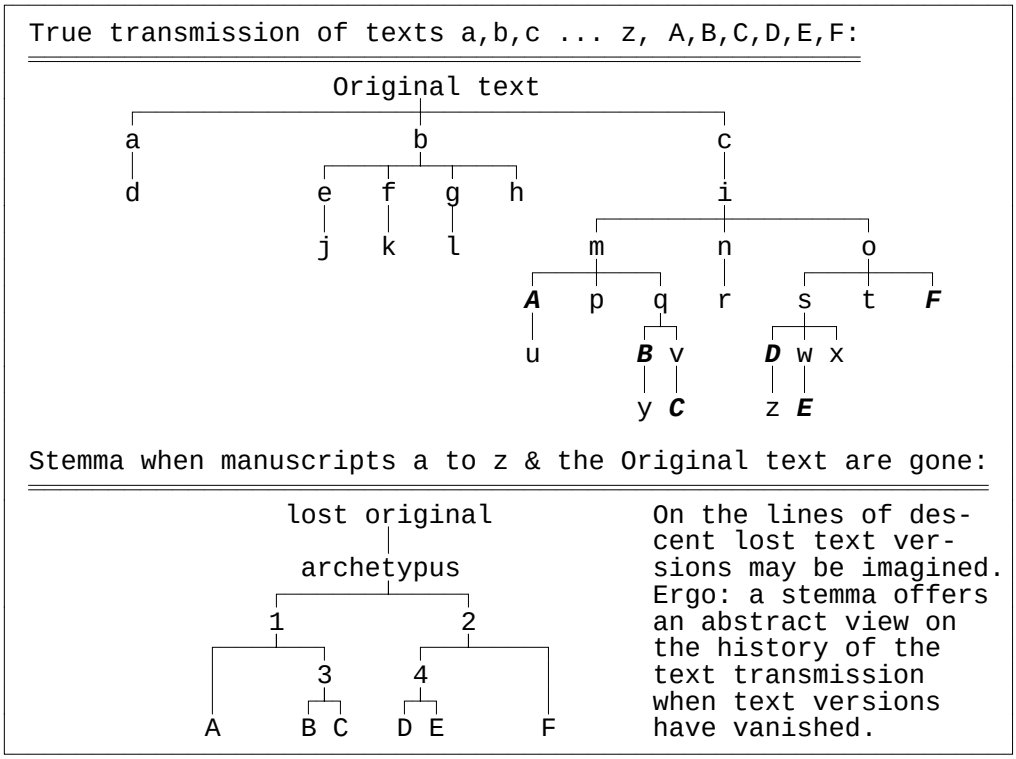
[4] Strictly speaking, A-1200, B-1100, etc., are sigla too.

The stemma in fig. 2 can be interpreted as follows. In 900 A.D. the original text was written; it was copied by two different copyists who produced the lost versions 1 and 2. Version 1 was copied into the lost version 3 and, in 1200, into the known version A. In 1100 and 1400 B and C were produced, etc.

This rough view needs a slight, but important, correction. It would be wrong to interpret a stemma as an exact historical picture of the history of the deliverance of the versions. One should bear in mind that a stemma is a *minimal* picture relating only to the text versions that still exist. Thus, a stemma can only be considered as a hypothesis about (a part of) the historic reality. On and around the lines of descent, we can imagine lost manuscripts whose contents are unknown.[5] Looking at fig. 2, it is, for example, not necessary that versions B and C in the stemma were copied directly from exactly the same *layer* (the text from which a copy is made). The stemma shows that B and C derive ultimately, but not necessarily immediately, from the same manuscript.



True transmission of texts a,b,c ... z, A,B,C,D,E,F:
Original text
a b c
d e f g h i
j k l m n o
A p q r s t F
u B v D w x
y C z E
Stemma when manuscripts a to z & the Original text are gone:
lost original
archetypus
1 2
3 4
A B C D E F
On the lines of descent lost text versions may be imagined. Ergo: a stemma offers an abstract view on the history of the text transmission when text versions have vanished.

Figure 3. A stemma offers an abstract historical view of the deliverance of text versions.

[5] Even the distances between the nodes can have a zero length. Under certain conditions (see §3.2.2), both nodes can be considered to be one and the same node. The distance between intermediate nodes can be zero as well. In this way *dichotomous* stemmas become *polytomous*. See also: Salemans (1987:199).

Fig. 3 sketches the relationship between the true history (the complete transmission of a text) in the upper half, and the stemma or the minimal historical subtree in the lower half. Suppose that only the uppercase A to F are existing text versions, while the lowercase a to z represent lost text versions. Notice that the stemma in the lower half is the same as the one in fig. 2.

Look at the positions of A, B and D in fig. 3. They are *intermediates* in the upper stemma, while they are *end nodes* in the lower stemma. Observe too how the rather multiform character of the upper stemma is converted into a *dichotomous* character; in reality, a text version may have been copied three or four times, while in the abstract view it seems that one version leads to two copies. Since a stemma provides an abstract view of the history, the dichotomous shape of a stemma does not mean that each text version was copied only twice. This is often forgotten in discussions about the dichotomous shape of stemmas.[6]

Now that we know that a stemma offers a (vague) picture of the historical relationships of text versions, and since we know how to interpret a stemma, we can describe the use of a stemma. The use? Is not the primary goal of a stemma, namely to give a historical picture of the deliverance and relationships of the text versions, enough? It is. But we can use a stemma as well as a tool for textual reconstruction. This will be discussed in the rest of this introductory section. The way stemmas are built will be discussed in the following sections.

We define a *reading* (or text element) as a span of signs (such as characters, punctuation signs and accents), uninterrupted by a space character in a text. A span of signs must contain at least one sign.

As can be seen in fig. 2, the first lines of the manuscripts have the following readings placed between quotes: (A:) ‘primus’, (B:) ‘unus’, (C:) ‘unus’, (D:) ‘nullus’, (E:) ‘nullus’ and (F:) ‘primus’. These readings at the same position in the text versions vary. Therefore, we call them *variant readings* or *variants*. In this case, there are three variants: ‘primus’, ‘unus’ and ‘nullus’. The fact that B and C show the same variant ‘unus’ can be explained by the assumption that at least the first common ancestor of B and C, in this case text 3, had the variant ‘unus’ too. (Notice that we say ‘first common ancestor’ and not ‘common ancestor’; text 1 is also a common ancestor of B and C; but it is not necessary that it had the variant ‘unus’.) The same is also true for D and E: they both have ‘nullus’, because their first common ancestor 4 must have had ‘nullus’. Text A and F read ‘primus’. The stemma shows that their first common ancestor is the archetypus text. Logically, the archetypus (and texts 1 and 2) must have had the reading ‘primus’ as well. In this way, we have reconstructed one reading of the archetypus text, which is close to the original text.

---

[6] See also: Hering (1967). Furthermore, the dichotomous shape of a stemma is caused because type-2 variants or common errors are used for its development.

The variant readings in the second lines of the manuscripts are (A:) ‘pater’, (B:) ‘agricola’, (C:) ‘mater’, (D:) ‘puella’, (E:) ‘mater’ and (F:) ‘homo’. The fact that C and E show the same variant can only be explained by the assumption that their first common ancestor, in this case again the archetypus text, had ‘mater’. Therefore, texts 1, 2, 3 and 4 must have had the reading ‘mater’ too.

The third lines have the variants (A:) ‘alfa’, (B and C:) ‘beta’, (D, E and F:) ‘gamma’. It is possible that the unique variant reading ‘alfa’ in text A is the reading of the archetypus text. From this, we learn that it is incorrect to assume that the variant with the highest occurrence (in this case three times ‘gamma’) is the archetypus reading. Notice, furthermore, that the readings of the archetypus text are not necessarily present in the oldest text versions. The relatively young texts A and F, dating from 1200 and 1500 A.D., have the archetypus reading ‘primus’, while older texts like D and E, both dating from 1000 A.D., have the derived, unoriginal reading ‘nullus’. In other words, the age of a text version or variant does not offer us trustworthy information about its originality. It is incorrect to assume that the oldest text version offers the archetypical or original readings.

We see that it is possible to derive certain reconstruction rules from the stemma (from which the archetypus text can be reconstructed). The basic archetypus reconstruction rule in the stemma in fig. 2 is:

> *Rule for the reconstruction of the archetypus text in fig. 2:*
> Whenever a reading ‘x’ occurs in A and/or B and/or C, and ‘x’ also occurs in D and/or E and/or F, ‘x’ is the archetypus reading.

This rule is not accurate enough. First, it does not express that it can be applied for every common unique ancestor of text versions. Suppose, for instance, that we want to reconstruct the lost intermediate node ‘2’. The stemma demonstrates that where D and/or E show a non-accidental reading which is also present in F, this must be a reading which was also present in ‘2’. Second, the rule has to be restricted at one point. It can happen that a variant reading is a so-called *accidental reading* or *accidental*. Then, the variant is not determined by the layer, but by writing peculiarities of the copyists. For instance, copyists very often have their own ways of using capital and small letters, orthographical or spelling systems, language (dialects!), etc. An accidental reading is so heavily copyist bounded, that agreement in accidental readings must be considered as coincidental.[7] Accidentals do not contribute to the revelation of relationships between the text versions. To distinguish accidental readings from non-accidental readings, we call the ‘non-accidentals’ *relevant or text-genealogical readings*.

---

[7] See Salemans (1989:336f.); Duplacy (1979:28); Epp (1976:168).

Keeping these remarks in mind, our 'mechanical' rule can be expressed more generally, applicable to all stemmas regardless of the text-genealogical methods with which they were generated:[8]

General rule for the reconstruction of an archetypus text:

A. A (relevant) reading in two or more text versions is *a common ancestor reading* of these text versions if two conditions are fulfilled:
   1. At least two text versions show the same relevant reading.
   2. The common ancestor is the first (and only) common ancestor of these text versions.

B. If the first (and only) common ancestor is the archetypus, a common ancestor reading is called an *archetypus reading*.

At this point, we are still discussing the use of a stemma. The question how a stemma can be built, will be discussed in the following sections. Observe that the applicability of our 'mechanical' rule A is restricted by both conditions 1 and 2. Thus, the rule can be applied only if both conditions are satisfied. Notice, furthermore, that Maas's observation[9] that text versions with unique variant readings cannot be used for the reconstruction of the archetypus text is in accordance with our mechanical rule which demands two or more text versions with the same variant, non-accidental reading.

Traditionally, the building of the stemma and the reconstruction of the archetypus text is called *recensio*. The (re)production process of the lost original text from the archetypus is called *emendatio*. *Emendatio* is the skill of replacing non-original readings in the archetypus text with original readings. The *recensio* always precedes the *emendatio*. This book focuses on the *recensio*; text reconstructions (*emendations*) are not treated in this book.

At the end of this section, we consider the status of the *archetypus* text. The archetypus is, by definition, the hypothetical common ancestor of the existing text versions. It is the 'greatest common dividend' of the still existing text versions. A close look at fig. 3 shows us that the archetypus text in the stemma in the lower half is likely to be more or less identical to text 'i' in the scheme of text transmission in the upper half. Therefore, the archetypus text can not necessarily be considered as a direct copy of the original text. On the other hand, it cannot be excluded that the archetypus text is identical to the lost original text. This is exemplified in the stemma in the upper half of fig. 3. If text 'd' would have survived, like versions A, B, C, D, E and F, the common ancestor (i.e. the archetypus) of these seven versions would have been the original text. Because in

---

[8] In §3.2.1 the notions relevant (or text-genealogical) reading and accidental reading will be further refined.

[9] See Maas (1957:7): *eliminatio lectionum singularium*.

our example only the six texts A to F have survived, their archetypus is lost text 'i', which is different from the lost 'Original text'.

Until now, we have spoken about the reconstruction of the archetypus. As illustrated, the archetypus text is composed by choosing, assembling and glueing readings of still existing versions together. For instance, we have found that the reading 'primus' from texts A and F, pictured in fig. 2, must be the archetypus text reading. One problem with the reconstruction of the archetypus text is that most languages show a *diachronical development*. They change during the course of time. Maybe the form 'primus', which according to the stemma did exist in 1200 and 1500 A.D, did not exist in 900 A.D., the year in which the lost original was created. This may not be true for Latin, but we know that many languages changed through the ages. For example, in the Middle Ages and later on, the Dutch language (or preferably the Dutch dialects, since a common Dutch language did not exist in the old days) was continuously evolving. Taking this diachronical change into consideration, it would be more accurate to state that the produced archetypus text has an artificial character. In other words, in most cases it is better to denote the archetypus text as a *construction* rather than a *reconstruction*. Later on, in §5.3.4.2.11, we will see that there is another problem that hampers the construction of the archetypus.

In this book, we will often speak about *original variants*; these are 'the variants that occur in the common ancestor of all the delivered texts, the archetypus'. As we know, the text of the archetypus text is not necessarily the same as the text of the lost original, since the archetypus text still can contain errors. In other words, in this book, *original variants* do not mean 'the variants present in the lost original', but 'the variants present in the archetypus' or 'the variants that are the closest to the lost original'.

This book deals with the production of text-genealogical trees, in our case the stemma of the fourteen text versions of the medieval play *Lanseloet van Denemerken*. I repeat that it focuses on the *recensio* and does not offer emendations (or text reconstructions).

2.3. Building a Stemma according to the (nineteenth-century) Method of Lachmann

In the previous section, we saw how a stemma can be used, not how it can be constructed. We will focus on stemma construction in this section. Specifically, we will discuss one of the oldest methods of building stemmas: the so-called *method of Lachmann*, named after the famous nineteenth-century German philologist Karl Lachmann. The name 'the method of Lachmann' may lead one to think that it refers to a specific text-critical method for stemma generation, clearly formulated by Lachmann in one or more publications. This interpretation is

incorrect. Lachmann did not formulate a method himself.[10] Several text genealogists have worked out some of his fundamental ideas, which they called the method of Lachmann. Paul Maas (see Maas 1957) is generally considered to have ultimately formulated the method of Lachmann.

The taxonomical principle (i.e. a principle to build taxonomies or genealogies with) of the method of Lachmann is simple and sound. If a certain number of text versions contains a *common error*, this can be explained by the assumption that this error was introduced in a common ancestor of these text versions. Therefore, the method of Lachmann is also known under the name *the common error method*. An error, in the Lachmannian sense of the word, refers to a change from a (supposed) original element in a text to a non-original element. Although the notion 'error' has a negative connotation, I am convinced that it should be understood in a neutral sense. It is possible for a copyist to introduce a Lachmannian 'error' which is not a deterioration, but rather a refinement of the original text. That is why we will refrain from using the negative term 'error'. We will refer to the traditional Lachmannian notion, common error, with *derived (non-original)*, *common change*, or simply with the single word *change*. The more common, non-original changes are found, the clearer the stemma becomes.

One may wonder why original common readings in text versions do not provide us with insights into the relationships of the text versions. The answer is simple. Original common readings are explained by the fact that the text versions derive from the same original text. However, that is information which we already knew. Logically, only derived common changes offer new genealogical information to build stemmas. Usually, a derived common change concerns a non-original reading in text versions. Other *non-textual elements* in texts, like the use of pictures, the number of lines on a page, etc., can provide genealogical information as well. In this study, however, we will focus mainly on the textual elements: the (textual) variants.

The way the nineteenth-century method of Lachmann constructs stemmas with common changes can be illustrated by the example pictured in fig. 4. Suppose we have six manuscripts with the sigla A to F, and the search for non-original (*derived*) common readings shows that these arise in: (change 1:) A and B; (ch. 2:) C and D; (ch. 3:) E and F; (ch. 4:) A, B, C and D. This results in the stemma in fig. 4a. We see that common change 1 is expressed by common ancestor (or *intermediate*) 'i3'. Change 2 leads to the assumption of common ancestor 'i4' and change 3 to 'i2'. Because A, B, C, and D all show change 4, common ancestor 'i1' must be assumed. Of course, it is possible that, for instance, A derives from B; then B takes over the place of node 'i3'. Finally, we join the ancestors 'i1' and 'i2' via 'O', since we assume that all the text versions derive from one text.

---

[10] For a discussion of the fundamentals of the method of Lachmann (see a.o. Lachmann 1876), read Castellani (1957), Fourquet (1946), Kristeller (1984) and Timpanaro (1971).

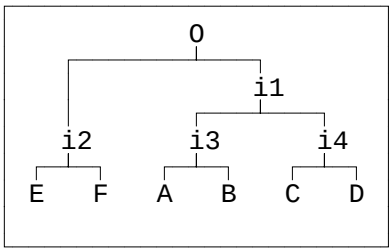


Figure 4. Stemma of arbitrary texts A to F, with four intermediate nodes i1 to i4 and one lost (intermediate) original text O.

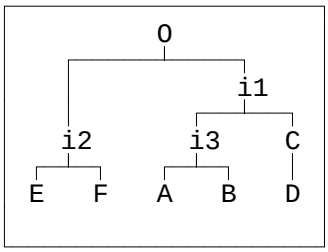

Figure 5. Now text C is an intermediate node; it took over the position of i4.

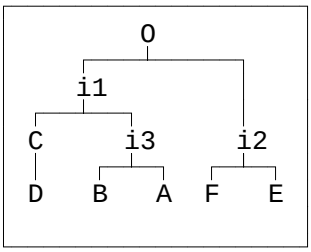

Figure 6. This stemma is equivalent to the one of fig. 5.

We already saw that lost texts can be imagined on and around the lines of descent. This kind of deliverance, in which it is assumed texts may have vanished, is known as an *open deliverance*. If we assume that all the produced text versions are delivered and that no text versions are missing, we speak of a *closed deliverance*. Notice that in the case of an open deliverance, lines of descent can have a length of '0' (zero). In that case, the common ancestor can be replaced by the text version which is at a distance zero from it.[11] When, for instance, it is clear that the distance between 'i4' and 'C' in fig. 4 is zero, 'C' takes the place of '4' and becomes an intermediate node. This is shown in fig. 5. In §2.6.1 we will examine the Lachmannian notion common error, which we know as derived common change.

Finally, if a node in a stemma splits into two or more branches, the left or right positions of these branches are unimportant. All that matters in a stemma is the expression of the parenthood. Therefore, the stemma in fig. 6 is equivalent to the one in fig. 5; both stemmas express precisely the same family relationships.

The main problem with the nineteenth-century method of Lachmann is that it is very often difficult to determine whether a reading in a text version is original or derived. In other words, the elements with which a Lachmannian stemma can be built are usually difficult to determine. As will be sketched in §2.4, Greg and Dearing, and most other modern text genealogists, use an alternative way of designing a stemma. They create a stemma in two steps. First, they determine the chain, which is the deep-structure or rough pattern of the stemma. Second, they construct (or *orient*) the definite stemma from that chain. The advantage of creating a stemma in this 'modern' way is that the interpretation (judgment) of the originality of a reading is not necessary to draw the chain. In this way, the main problem with the method of Lachmann is solved for the most part. However, the

[11] See Salemans (1987:199), presented here in English translation, in Appendix E. With the cladistic Wagner network algorithm, discussed in §3.3 of Salemans 1987 and in Appendix E, the distances between nodes can be measured. The distance between two nodes can be zero, in which case the two nodes are one and the same node.

second step, the orientation of a chain into a stemma, is still based on the knowledge of the (un)originality of usually two or three readings, as shown in §2.4.

An example will enable us to compare the differences between the stemma-building methods of Lachmann and of Greg/Dearing. Suppose that we have seven text versions A to G. Suppose further that a comparison of these texts results in the detection of nine spots where the text versions differ. The detected variants are expressed in fig. 7.

Figure 7 is self-explanatory. For instance, it is clear, that at *spot* or *variation place* no. 4, the text versions A to D have the variant ‘ha’, while text versions E to F have ‘hi’.

		(seven text versions A to G)						
		A	B	C	D	E	F	G
(nine places of varia-tion)	1.	x	x	y	y	y	y	y
	2.	a	a	a	a	a	b	b
	3.	α	α	α	β	β	β	β
	4.	ha	ha	ha	ha	hi	hi	hi
	5.	τ	τ	τ	τ	δ	δ	δ
	6.	m	m	m	n	n	p	p
	7.	q	r	s	t	u	v	v
	8.	e	f	f	f	f	f	f
	9.	h	i	j	k	l	m	n

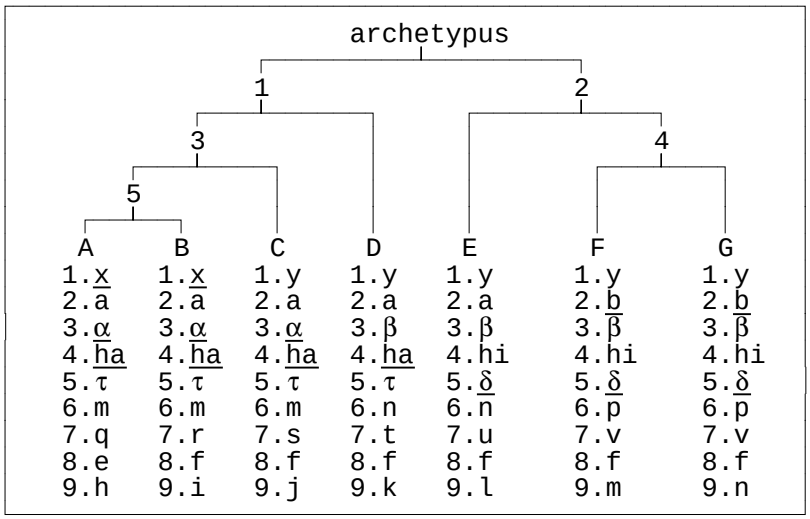
Figure 7. Variants of texts A to G at nine variation places.

To construct the stemma in the Lachmannian way, we must determine the originality of the variants. At least five judgements about the (un)originality of the variants are necessary. As we will see in §2.4.5, Greg and Dearing only require two judgements. Simply accept that the judgements expressed in fig. 8 are correct.

```
judgement 1: ‘x’ = common change, occurring in A-B-
judgement 2: ‘b’ ? common change, occurring in F-G-
judgement 3: ‘α’ = common change, occurring in A-B-C-
judgement 4: ‘ha’ = common change, occurring in A-B-C-D-
judgement 5: ‘δ’ = common change, occurring in E-F-G-
```

Figure 8. Five assumed Lachmannian judgements about the originality of variants.

(We use the convention to express a group by mentioning the names or sigla of the text versions, each followed by a hyphen ‘-’; in variation formulas the hyphens are often left out.) The five common changes point to five text version groups A-B-, A-B-C-, A-B-C-D-, F-G- and E-F-G-, with which we can build the following stemma, dislayed in fig. 9:



archetypus
1
2
3
4
5
A B C D E F G
1.x 1.x 1.y 1.y 1.y 1.y 1.y
2.a 2.a 2.a 2.a 2.a 2.b 2.b
3.α 3.α 3.α 3.β 3.β 3.β̄ 3.β̄
4.ha 4.ha 4.ha 4.ha 4.hi 4.hi 4.hi
5.τ 5.τ 5.τ 5.τ 5.δ 5.δ 5.δ
6.m 6.m 6.m 6.n 6.n 6.p 6.p
7.q 7.r 7.s 7.t 7.u 7.v 7.v
8.e 8.f 8.f 8.f 8.f 8.f 8.f
9.h 9.i 9.j 9.k 9.l 9.m 9.n

Figure 9. The stemma of the seven texts A to G.

The five derived, unoriginal, variants, described in fig. 8, have been underlined. Using the general rule (see §2.2) for the reconstruction of an archetypus text, we see that the readings of the archetypus in fig. 9 are (1)‘y’, (2)‘a’, (3)‘β’, (6)‘n’, (8)‘f’. It is not possible to determine the archetypus reading of variation places 4, 5, 7 and 9, strictly based on the stemma. Especially the sixth variation place is interesting. As we will discuss in §2.4.2 and §2.4.3, the variants in variation places 6, 7 and 9 (with three or more variants) and 8 (with one unique variant in one text version versus one other variant in all of the other text versions) cannot be used to build the chain of a stemma. Although variation place 6 is useless for tree building purposes, it is possible to determine that the archetypus reading is ‘n’, once we know the stemma.

2.4. Building a Chain and a Stemma according to the (twentieth-century) Method of Greg/Dearing, Compared with the Method of Lachmann

2.4.1. Introduction

In the previous section we saw how a stemma can be built using the nineteenth-century method of Lachmann. One of the problems of this old method, which is still used by some contemporary philologists, is that it is difficult to determine the originality of a reading. In this section, we will study modern, alternative twentieth-century methods of stemma construction which deal with this problem and reduce it. Most twentieth-century methods have in common that they first determine the shape or deep-structure of the stemma (the chain) and that they then raise (orient) a stemma from this chain. For the construction of the chain no

knowledge about the originality of variants is necessary. We will discuss now the twentieth-century methods of Greg (1927), also known as *Greg's Calculus*, and Dearing (1974), an elaboration of Greg's method.

2.4.2. TYPOLOGY OF VARIATIONS AND THEIR NOTATION

Modern text genealogists, like Dearing and Greg, use a *special way of notating variations in variation formulas,* which will be explained in this section. To prevent a confusion of terms: *variation* is the phenomenon that text versions show different readings (*variants* or *variant readings*) at the same spot (*variation place* or *variant place* or *place of variation*) in the text versions. The phenomenon of *variation* can be expressed in *variation formulas*.

The notation of these formulas is based on the principle that the sigla of text versions with the same variant must be grouped together and separated from the sigla of text versions with other variants. Greg, Dearing and most other modern text genealogists use special separation markers, like ':' or '/' or '|', which must be read as 'versus'. For example, a variation formula like AB:CDE must be interpreted as follows: there are two text versions A and B which both show the same variant (i.e. reading 'x'), and there are three text versions C, D and E which all have another variant in common (i.e. reading 'y').

Normally, when we refer to a group of people, we assume that this group consist of two or more human beings. However, we can use the notion *group* in a mathematical sense. Then, a group can consist of only one member or element as well as several elements. We define a *true group (or type-2 group)* as a group containing two or more members. In this way A-B- are one true group and C-D-E- another true group. In other words, the formula AB:CDE contains two true groups. The formula A:BC:DEF has three groups: one group (with one member) A-, one true group B-C- (with two members) and one true group D-E-F- (with three members).

The order of the sigla within a group and the order of the groups is of no importance. The variation can be recorded in many ways, as long as the members of the different groups are clearly recognizable. Therefore, BA:DCE, AB:EDC, CED:AB, etc., are the same variation formulas as AB:CDE.

Often the variants are integrated into the variation formula. Using our example with the 'x' and 'y' variants, and using the separation marker '|' instead of ':', this leads to the formula: AB|CDE='x'|'y'. Notice that the order of presentation of the variants 'x' and 'y' following the equal sign is identical to the order of the sigla of the text versions before that sign. According to this convention it will be clear that 'x' is the variant occurring in texts A and B, and 'y' in C, D and E. A formula like ID|XZ|T='a'|'b'|'c' expresses that text versions I and D have variant reading 'a', X and Z show 'b', while T has 'c'. Of course the formula ZX|T|ID= 'b'|'c'|'a' is equivalent. Although the order of the sigla within a group and within a formula is not important, we use some conventions in

the notation of variation formulas. Roughly speaking, the method of ordering the sigla is as follows. First, the order of the sigla within in a (true) group is alphabetical. Therefore, we speak of the group 'XZ' (or 'X-Z-') instead of 'ZX' (or 'Z-X-'), and of 'DI' (or 'D-I-') instead of 'ID' (or 'I-D-'). Second, in the formula the smallest group comes first, in our case 'T' (or 'T-'). Then, the second smallest group is presented. When there are more candidate groups with an equal number of sigla, like in our case 'DI' and 'XZ', the order is alphabetical again. Using these conventions,[12] we change the original formula ID|XZ|T='a'|'b'|'c' into the preferred formula T|DI|XZ='c'|'a'|'b'.

Now, we will take a closer look at Greg's and Dearing's theories. Both Greg and Dearing distinguish *two main types of variation*: the simple and the complex variation. A *simple variation* is defined as the phenomenon that a variation place shows in all the text versions precisely two competitive variants. In the stemma in fig. 9 variation places 1 to 5, and variation place 8 show this type of variation (resp. 'x'|'y', 'a'|'b', 'α'|'β', 'ha'|'hi', 'τ'|'δ', 'e'|'f'). When a variation place shows more than two competitive readings, Greg and Dearing speak of a *complex variation*. Complex variations show up in variation places 6, 7 and 9. In variation place 6, we find three variants: 'm'|'n'|'p'; in variation place 7 six variants: 'q'|'r'|'s'|'t'|'u'|'v'; in variation place 9, we even find seven variants: 'h'|'i'|'j'|'k'|'l'|'m'|'n'). Often the notions 'variation' and 'variation formula' are synonymous.

The simple type of variation can be separated into two subcategories, the type-1 and the type-2 variation. In the *type-1 variation* exactly one text version shows one reading where the rest of the text versions all show one other competitive reading. Because we define a true group or type-2 group as containing two or more members (sigla of text versions), we can say that a type-1 variation is a simple variation containing one true group of text versions with one variant, while a single text version (ergo: not a true group) shows the other variant. In the *type-2 variation*, two or more text versions show one variant while the other variant is present in the rest of the, at least two, text versions. In other words, a type-2 variation shows two competitive variant readings, which are present in precisely two true groups of text versions.

Likewise, the complex type of variation (with three or more competitive variant readings) can be separated into three subcategories. Again this division depends heavily on the number of true groups. A *type-0 variation* is a complex variation without a true group of text versions containing the same variant. This kind of variation occurs at variation place 9 (formula: A:B:C:D:E:F:G), where all the text versions show different variants. A complex variation with precisely one true group of text versions with the same variant is called a *type-3 variation*. An example is shown at variation place 7, in which F and G show 'v' and A to E all have different readings (formula: A:B:C:D:E:FG or FG:A:B:C:D:E). The final

[12] More information about the notation of variation formulas can be found in Dearing (1974:57-58).

type of complex variation is the *type-4 variation*, a complex variation in which at least two true groups (or type-2 groups) are present. An example of this type is found in reading 6, in which A, B and C have variant ‘m’, D and E have ‘n’, and F and G have ‘p’ (formula: ABC:DE:FG). In fig. 10, all the types of variation are displayed schematically:

	Two variants (SIMPLE variation)	More than two variants (COMPLEX variation)
No true group	(type-0 (A:B))	type-0 (A:B:C:D:E)
One true group	type-1 (A:BCDE)	type-3 (AB:C:D:E)
Two true groups	type-2 (AB:CDE)	type-4 (AB:CD:E)

Figure 10. The five types of variation: type-0 to type-4.

Fig. 9 pictures a stemma and nine variation places with the occurring variants. In fig. 11, these variants are offered again, now in nine variation formulas.

Notation of variation formulas, extracted from fig. 9:

```
Formula 1: AB:CDEFG=‘x’:’y’                                (type-2)
Formula 2: FG:ABCDE=‘b’:‘a’                                (type-2)
Formula 3: ABC:DEFG=‘α’:‘β’                                (type-2)
Formula 4: EFG:ABCD=‘hi’:’ha’                              (type-2)
Formula 5: EFG:ABCD=‘δ’:‘τ’                                (type-2)
Formula 6: DE:FG:ABC=‘n’:‘p’:‘n’                           (type-4)
Formula 7: A:B:C:D:E:FG=‘q’:‘r’:‘s’:‘t’:‘u’:‘v’            (type-3)
Formula 8: A:BCDEFG=‘e’:‘f’                                (type-1)
Formula 9: A:B:C:D:E:F:G=‘h’:‘i’:‘j’:‘k’:‘l’:‘m’:‘n’       (type-0)
```

Figure 11. Examples of variation formulas and the types of variation they belong to.

2.4.3. THE IMPORTANCE AND THE LIMITATION OF TYPE-2 VARIATIONS; THE VIRTUE OF TYPE-1 VARIATIONS

The importance of the simple type of variation and especially of the type-2 variation for generating a chain is clearly formulated in Greg (1927:20-23): ‘only those variants which give rise to at least two groups or more than one each can be described as (genetically) *significant variants*. And only those which give rise to groups all of which are of more than one manuscript can be described as *completely significant*. (...) [Therefore] only such variation as we see in type 2 is fundamentally significant.’ In Salemans (1989:331), I formulated this as:

> *The fourth text-genealogical basic rule:*
> If all the text versions show at a variation place together exactly two genealogically significant variants, which each occur in at least two text versions, these variants can be used directly for the determination of the deep-structure of the stemma (the *chain*). This kind of variation is called a *type-2 variation*.[13]

Dearing also uses type-1 variations for the construction of the chain. Greg (1929:19) states that type-1 variations are useless for building text-genealogical trees: 'since every manuscript contains variations from its immediate source, any reading supported by one manuscript alone may have originated in that manuscript, and such a reading therefore cannot, without further analysis throw any light on the relation of the manuscripts'.[14] In other words, according to Greg, unique (type-1) variants do not provide any new information about the relationship between text versions, since he assumes that unique variants will always be present in every text version. Greg assumes that text versions cannot be intermediate nodes in the chain. All the text versions occur as end nodes in the chain. For the stemma, this implies that - apart from the original text - text versions cannot be ancestral nodes.

Does the fourth text-genealogical rule imply that type-1 variation are useless or that it is forbidden to use them? No. Admittedly, with type-2 variations we can draw a perfect chain. However, the consequence of using strictly type-2 variations is that text versions cannot be intermediate nodes in a chain or (intermediate) ancestral nodes in a stemma. This is not problematic if we accept that a stemma offers an abstract historical picture of the relationships between text versions (see fig. 3). Nevertheless, it is fascinating and interesting to know whether a certain delivered text version is a (distant) ancestor of another text version. Furthermore, I have a kind of presentation problem in the case of the *Lanseloet van Denemerken* texts. As we will see in §5.2.1 to §5.2.4, parts of the *Lanseloet* stemma have been presented by Leendertz (1907), Goossens (1973, 1976) and Hüsken & Schaars (1984). In their stemmas, at least one text version occurs as an intermediate ancestral node. The problem is that if I present a *Lanseloet* stemma without one or more text versions as intermediates - caused by the type-2 variations - the audience may think that it is less accurate. It is not; it has possibly a higher level of abstraction, but a stemma without texts as intermediate

---

[13] As is explained in Salemans (1987:214) and as we will discuss in §2.5.2 and §2.6.1.2, it is also possible to use complex variations to build a chain. Then, the *transformation order* of the variants must be stated, which means that we have to determine how the variants changed into each other. Most of the time, the determination of the transformation order is very difficult. When we build chains from simple variations (with two variants), the difficult determination of the transformation order is not necessary, since it is aleady known to us; one variant led to the other or vice versa.

[14] Other text genealogists like Colwell and Tune (Colwell & Tune 1969:105), Duplacy (Duplacy 1979:28f) and Epp (Epp 1976:169f) state too that unique variant readings are not genealogically significant. See also Salemans (1989:330-332).

nodes may offer a quite accurate picture of the historical deliverance of the texts. This is what I will do. First, I will use type-2 variation to build the chain. Then, I will try to find out whether some of the texts might be intermediate nodes. I will use type-1 variations for that purpose.

If a text version does not have a *unique reading*, its distance to an intermediate node in the chain or stemma will be zero. Then, the text version may take the place of the intermediate node in the tree and will become an intermediate node, as shown in fig. 4b. This removal or disappearance of a branch with a zero length is called the *collapsing* or *contraction* of a tree branch, and will be discussed further in §3.2.2. Before we collapse a tree branch, as a result of which a text version becomes an intermediate node, we must be sure that this text version does not have unique variants, which do not appear in other text versions. In other words, such intermediate text may not occur in a type-1 variation as the text with an unique variant. If it does, we know that it cannot be an intermediate. If it does not, it may be an intermediate. I say 'may' and not 'must', because the determination of an intermediate node is difficult. In fact, a missing observation - namely the absence of unique variants - is used as a positive observation of intermediateness. This will be discussed in §3.2.2. Nevertheless, if one is interested in intermediate nodes and ancestral texts, type-1 variations regain their importance. If one is not interested in such detailed information, type-2 variations are sufficient.

2.4.4. Building a Chain with Type-2 Variations: Dearing's Rules for Building Chains with Transformed into a New Algorithm; the Notion 'End Group'

With the variation formulas in fig. 11, we can construct the chain. As stated earlier, we only use type-2 variations expressed in formulas 1 to 5 for this goal. The advantage of working with type-2 variations is that judgements about the (un)originality of the two variants are not necessary.

Dearing (1974:74-77) provides us with a set of rules for building chains. The idea behind his rules is that one must find small groups of sigla with the same variants and connect them with lines. Then, step by step, new sigla are connected to these small patterns of interlinked sigla. The structure of the already detected groups remains the same; it is only expanded by the new sigla. The final result is the chain, one pattern of all the sigla, connected by lines. We cannot use all of Dearing's rules, because he also uses type-1 groups to develop the chain. Since we generally use type-2 variations, Dearing's set of rules is adapted to a new algorithm shown in fig. 12.

Notice that the algorithm denotes the Wagner network method as an alternative method to build chains. That method is explained in Salemans (1987), and printed, in translation, in Appendix E of this study. Furthermore, step six of the algorithm is elaborated. Dearing's original instruction was, too simple, to connect all the parts of the chain through one common point. This instruction

needed to be elaborated, because parts of the chain can be connected through one common point in several ways.

```
Step 1: Make a list of type-2 groups: from each type-2 variation we
        take the smallest group of manuscript sigla and write it down
        in a 'list of type-2 groups'. If two groups in a type-2
        variation formula contain an equal number of sigla, they must
        both be inserted in the list of type-2 groups. Go to step 2.
Step 2: Draw horizontal lines out of all the sigla. Go to step 3.
Step 3: Take the smallest group in the list of type-2 groups and
        remove it from the list. This is the 'current type-2 group'
        we will work with. If there is more than one group with an
        equally small size, we arbitrarily choose one of them. If it
        is not possible to choose a 'current type-2 group' out of the
        list, because it is empty, we go to step 6. Otherwise, we
        have to decide which of the following four possibilities is
        occurring and follow the accompanying instructions:
        3a. None of the members of the current type-2 group is to
            other sigla yet. Go to step 4.
        3b. All but one member of the current type-2 group are
            already (inter)linked by lines. Go to step 5.
        3c. Two or more members of the current type-2 group have no
            links with other sigla. The chain cannot be drawn! More
            type-2 groups are needed. Stop all action.
        3d. All the members of the current type-2 group are already
            linked by lines. This means trouble: the type-2 group
            cannot take its place in the chain. This is caused by
            conflation (= contamination), parallelism or incorrect
            variants. Stop all action. Reconsider the variants or
            use e.g. the Wagner network method (see Salemans (1987),
            printed, in translation, in Appendix E).
Step 4: Connect the lines of the sigla of the current type-2 group.
        Then draw a new horizontal line from this point of connection.
        Redrawing may be necessary to get the results to come out
        neatly. Go to step 3.
Step 5: Draw two lines at the end of the horizontal open line sticking
        the already connected sigla. One of the two lines should be a
        vertical line, under which we place the new, not-connected
        siglum of the type-2 group, and the other should be a new
        horizontal line. Go to step 3.
Step 6: This is the final step in which we finish the chain by
        connecting all the open line ends to one connection point.
        6a. Redraw all the developed parts of the chain by putting all
            elements of these parts below their horizontal lines;
            each horizontal line must be open left and right, so that
            other parts of the chain can be connected at both sides.
            Go to 6b.
        6b. Connect the parts through one connection point; the
            resulting chain must be in accordance with the variation
            formulas. Remove all the dead-end lines. Go to 6c.
        6c. Redraw the left and right sides of the chain (this is not
            necessary, but more or less an aesthetic change). The
            chain is ready. Stop all action.
```

Figure 12. Salemans's algorithm to build chains from type-2 variation formulas.

Using the formulas in fig. 11, we can study how the algorithm works. Step 1 results in the list of type-2 groups: A-B-, F-G-, A-B-C-, E-F-G-. The result of step 2 is presented in fig. 13a. Arriving at step 3, we see that the smallest group

in the list of type-2 groups is A-B- or F-G-. We arbitrarily choose one of these two groups, A-B- (we could have picked F-G- as well), and remove it from the list of type-2 groups. Since neither A nor B is already connected to other sigla (situation a), the algorithm instructs us to perform step 4, which results in fig. 13b. Then, we are directed to return to step 3 again. Currently, the list of type-2 groups has shrunk to F-G-, A-B-C- and E-F-G-. Again we choose the smallest group, now F-G-, and discard it from the list of type-2 groups. Next, we follow the instructions in step 4, which results in fig. 13c. We return to step 3. Arriving at step 3, we look at the contents of our list of type-2 groups: A-B-C- and E-F-G-. Since both groups consist of three members, we arbitrarily choose group A-B-C- to be the current type-2 group and remove it from the list of type-2 groups. Seeing that all but one member, namely A and B, of the group A-B-C- are already interlinked by lines (situation 3b), the algorithm instructs us to go to step 5. The result of step 5 is shown in fig. 13d. We return to step 3 again. The only remaining group in the list of type-2 groups is E-F-G-. Situation 3b instructs us to go step 5. Now fig. 13e can be produced. We go back to step 3. No type-2 groups are left in the list. We jump to step 6.

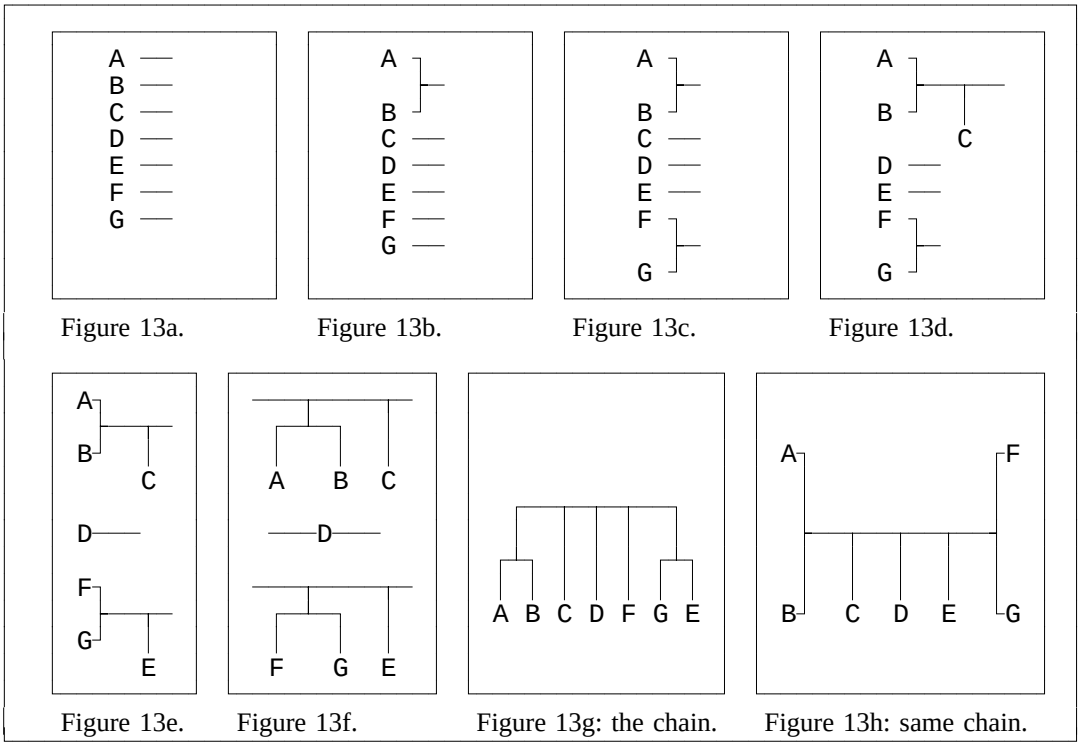


Figure 13a. Figure 13b. Figure 13c. Figure 13d.

Figure 13e. Figure 13f. Figure 13g: the chain. Figure 13h: same chain.

Figure 13. Salemans's algorithm in fig. 12 demonstrated (in figs. 13a to 13h).

As explained above, step 6 in Dearing's algorithm was too simple. According to Dearing all the open horizontal lines (in fig. 13e) should be connected through one central connection point. There are several possiblities to connect the several open horizontal lines; Dearing does not provide information how to connect which lines. Our step 6 consists of at least two substeps, and is, therefore, more complicated than Dearing suggests. Step 6a lets us redraw the three parts of 13e, as pictured in fig. 13f. Then, step 6b orders us to connect the open ends of the lines through one point, in such way that the resulting chain is in accordance with the variation formulas. In these formulas (see fig. 11), we find a group D-E-F-G- in formula 3 and a group A-B-C-D- in formula 4. This means that D must be connected to A-B-C- and to E-F-G- in such way that D stands between both groups. The result is the chain of manuscripts in fig. 13g. The chain in fig. 13h is drawn according to the instructions of final step 6c; however, the chains in figs. 13g and 13h are totally equal.[15]

Let us reconsider why we use groups from simple (type-1 and type-2) variations as elements to build chains. Simple variations have precisely two competitive variants. One variant is present in one group of texts; the other variant is in the complement group. In other words, simple variations always split up the texts into two groups of texts. As will be explained in §2.5.2, the first group of a simple variation must stand on one side of the chain, while the second (complementary) cluster must stand on the other side of the chain. These groups of simple variations are *end groups*, because they stand at one side, or end, of the chain. It is easy to denote end groups in a chain, if we use an imaginary pair of scissors to cut through one line in the chain. This is demonstrated for the chain (presented in fig. 13g) in figs. 14a to 14c, in which such a cut is visualized by a '#'.

---

[15] In 1990 a critical reviewer of an early version of an article I wrote, remarked the following on the use of the algorithm: "1. Only one insignificant parallelism has to occur in the text versions, and the Salemans algorithm concludes: consult a cladist! 2. I would like to propose the following (and that is the way I do it: manually, without the computer): I search for *heavy* (i.e. not trivial or accidental) variants which are strongly relationship-revealing. 3. Then, I build a hypothetical chain or stemma. Having this chain or stemma, I look to see which variants do not fit in this hypothesis. 4. Then, I determine whether it is possible that the violating variants are parallelisms. If they are, I reject them. I perform the weighing after building a chain or stemma." My comment to these objections consists of three remarks. First, it would be inconvenient indeed should one contradicting variant prohibit us from developing a chain. Of course, I will reconsider whether this (one) variant is genealogical or, for instance, a parallelism which slipped through. However, when it is genealogical, we must face the fact that it is simply not possible to build a chain with the algorithm. Second, I am interested in tracing only heavy kinship-revealing variants too. Third, I fear that the adjustment of the variant material afterwards will be too ad hoc. The text genealogist could easily fool himself.

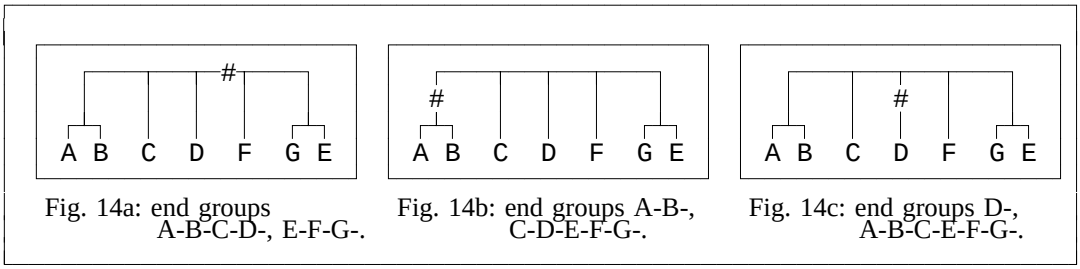

Fig. 14a: end groups A-B-C-D-, E-F-G-.

Fig. 14b: end groups A-B-, C-D-E-F-G-.

Fig. 14c: end groups D-, A-B-C-E-F-G-.

Figure 14. End groups are connected to a chain by one line of connection. If we cut ('#') such a line, the chain splits into two end groups (occurring in simple variations; see fig. 10), as is demonstrated in figs. 14a to 14c.

If we know the end groups of the chain, we know how to compose the chain. Groups in simple (type-1 and type-2) variations are always end groups in the chain. That is the reason why we use them to build chains. In a complex variation formula like AB:CD:EFG, with three groups, the groups are not necessarily end groups. If we look at figs. 14a to 14c, we see, for instance, that group C-D- is not an end group, because it is not possible to separate this group from the chain by cutting one line of connection.

Now what about the difference between type-1 and type-2 variations, which are both simple variations (see fig. 10)? If we accept beforehand that all the single texts are (single-member) end groups, type-1 variations like D:ABCEFG (see fig. 14c) do not provide new information. One the other hand, if we only allow single texts to be end groups if they really occur in a type-1 variation, type-1 variations do provide useful information. Then, single texts that do not occur in type-1 variations may be *intermediate nodes* (nodes that stand between the end nodes) in the chain. End nodes are connected to the chain by one (end) line, while intermediate nodes sprout at least two lines.

2.4.5. ORIENTING A CHAIN INTO A STEMMA

At first sight, the chain in fig. 13g does not resemble the stemma in fig. 9. We may consider the chain to be the lower structure or deep structure of a stemma. In the chain, the originality of the variants is not important; we did not use any judgements about their originality to develop the chain. We can turn or *orient* a chain into a stemma, by considering the originality of some of the variants. In §2.5.2 on the ordering of taxons with features, we will discuss the backgrounds of the orientation of a chain into a stemma. We will see that we always have to determine some original *feature states* (in our case original variants) to make a genealogy (in our case a stemma) from a chain. For now it is sufficient to note that it is impossible to develop a stemma from a chain without determining at least some original variants.

At this time, we will not discuss the difficulties of detecting original variants.[16] Simply suppose that we have discovered that in the fourth variation place (formula: EFG:ABCD), the variant 'ha' (occurring in E-F-G-) is the original reading (= Orig.1). Suppose further that we have judged the variant 'δ' in the fifth variation place (formula: EFG:ABCD; 'δ' occurs in in E-F-G-) to be the original reading (= Orig.2). As is pictured in the upper half of fig. 15, the area in the chain which shows both original readings 'ha' and 'δ' can be found on the line between the groups A-B-C-D- and E-F-G-. Therefore, in that particular area, we find the *point of orientation* (i.e. the place in the chain where the original text with strictly original feature states is located), indicated by the vertical arrow. By pulling up the chain at the point of orientation, we arrive at stemma 1 in the lower half of fig. 15.

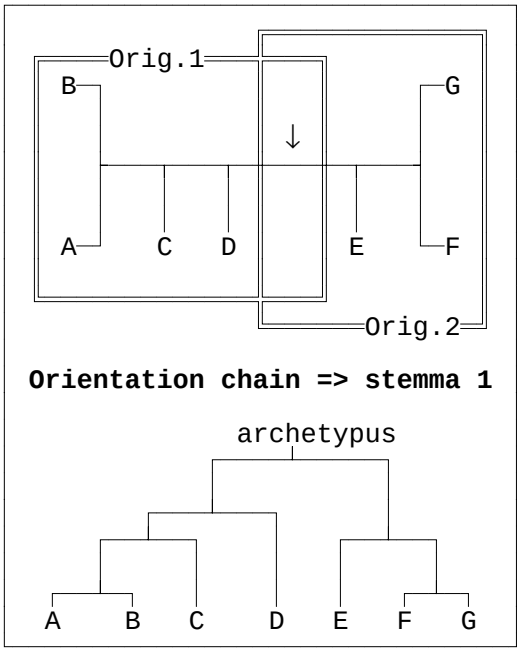

Figure 15. Orienting the chain into a stemma.

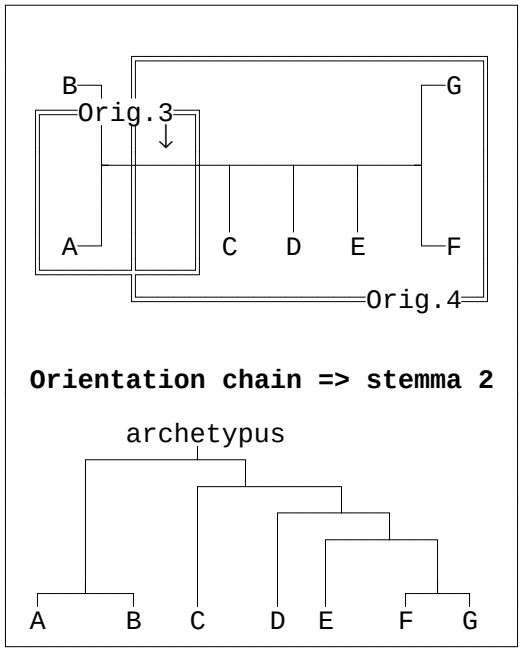

Figure 16. Another point of orientation on the chain leads to another stemma.

[16] One possible way of detecting an original reading is the principle of the *lectio difficilior*. It is based on the plausible thought that a copyist will seldom introduce a variant in his copy which is more complex to understand than the reading of his layer. The general aim of the copyist is to produce a new copy of a text. When he encounters a text part in his layer which he does not understand immediately (for instance caused by a difficult syntactic construction), he will sometimes feel the need to change it to make it easier to understand. Maas calls this *Trivialisierung* (Maas 1957:11). Most of the time, the difficult (but syntactic and semantical correct) reading will be the original reading. Continuation errors, which often occur in prose texts, seem to be very useful for the orientation of a chain into a stemma as well.

In fig. 16, the same chain is oriented at another point of orientation (denoted by the arrow ↓). This results in another stemma: stemma 2. Partly, the point of orientation is determined by the judgement that text version A has an original reading (resulting in area Orig.3). This is possible when we conclude that the reading 'e' in the eighth variation (formula: A:BCDEFG) is the original one, or that the 'f'-reading in the ninth variation (formula: A:B:C:D:E:F:G) is the original. The other judgement, leading to area Orig.4, could be that in the first variation (formula AB:CDEFG) the reading 'y' is the original reading, appearing in C-D-E-F-G-.

A *(text) family* in a stemma is a group of texts that all share a unique common ancestor or ancestral node from which no other text sprouts. All the texts that derive from one ancestral node are (members of) a family. In stemma 2 (fig. 16) texts C-D-E-F-G- are a family because all these texts can be retraced to one common ancestor. Texts D-F-G- are not a family, because text E also goes back to the same common ancestor. In other words, D-F-G- are a part of the family D-E-F-G-. Texts A-B-C- in stemma 2 are not a family, because (all) other texts are derived from their common ancestor, the archetypus. Notice that in the chain in fig. 16 group A-B-C- is an end group. If a group of texts is an end group in a chain, this group is not necessarily the same as a family in a stemma; on the other hand, every family in a stemma is an end group in the chain.

For determinating the point of orientation, not only type-2 variation formulas but all kinds of variation formulas can be used. The restriction of type-2 variations only holds for the development of the chain. Of course, the stemmas in fig. 15 and fig. 16 are contradictory, since it is not possible that both differently shaped stemmas illustrate the same genealogical relationship between the text versions. Both stemmas are *dichotomous*, which means that each time two lines originate from every intermediate node. The dichotomy is due to the tools with which the stemmas were built. These tools, the type-2 variations, always separate the sigla into two clustered camps.

If we compare the stemma in fig. 9, §2.3, generated by the nineteenth-century method of Lachmann, and the stemma in fig. 15, determined in two steps (chain, stemma), we see that the two stemmas are identical. 'Lachmann' needed *five judgements* as to the originality of variants to build the stemma. The modern, twentieth-century method only required *two judgements* about the originality, in the phase that determines the point of orientation. Since it is difficult to pass these judgements as to the originality of variants, it seems that the modern chain to stemma approach is easier to perform. However, this positive gain must be put into perspective. The (new) problem the modern chain to stemma methods face is that many decisions must be made about which variants may be used to build text-genealogical trees. In this book (see a.o. §2.5.1, §2.6.2 and §3.2.1) we stress that only a few variants can be used for that purpose, while most modern methods seem to use all/most occurring variants.

One could remark that at least two judgements about originality are still needed when using *the chain to stemma method* and that this is not totally objective. This would be a correct observation. However, the term *objective* seems to relate to the opinion that, in general, one should aim for a kind of stemma science which is as empirical and as objective or non-subjective as possible. As we know, *induction* is the method of generalizing from many observations. It is often hailed as 'the' scientific method. The text-genealogical research presented in this book is not inductive, but deductive. It is what Gaffney (1979) calls a *hypothetico-deductive method* (in the sense of Popper 1979) and goes back to fundamental, general hypotheses (in our taxonomical case, *general features*) which can be used to produce chains and stemmas. These features (*hypotheses to build genealogies with*) are falsified, when it is shown that they fail to produce the correct ordering they were designed for. Then, the hypotheses have to be rejected or reformulated into more adequate hypotheses. There is nothing wrong with judging variants on their originality, as long as these 'originality' hypotheses can be falsified or attacked. One could claim that the judgements in the method of Lachmann are hypotheses as well. However, most of the time they are not good general hypotheses, but tend to be ad hoc and difficult to falsify.

Several different stemmas can be generated from one chain depending on the choice of the point of orientation. Bédier (1928) discovered that the history of the text deliverance of the *Lai de l'Ombre* was sketched in many differently shaped stemmas. He tried to demonstrate that text-genealogical methods, leading to many different end results, are worthless. However, a close study of these stemmas shows that they can all be derived from one and the same chain.[17]

Figs. 17 and 18 reveal that we can draw eleven different stemmas from one chain, which was created out of the variation formula AB:CD. In fig. 17, the chain is presented, in fig. 18, the accompanying eleven stemmas.

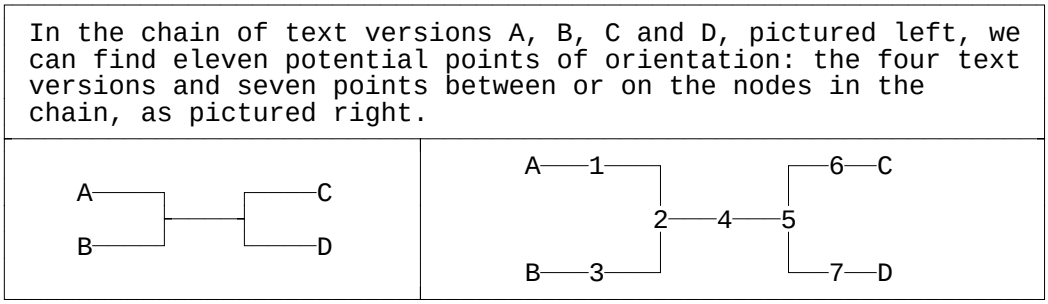

Figure 17. The chain for the type-2 variation AB:CD, with eleven potential points of orientation: seven points in the chain plus the four texts.

[17] See Dees (1976:484), Galloway (1982) and Salemans (1990:455). In Salemans (1987) and (1989) other points of Bédier's criticism of text-genealogical methods are discussed.

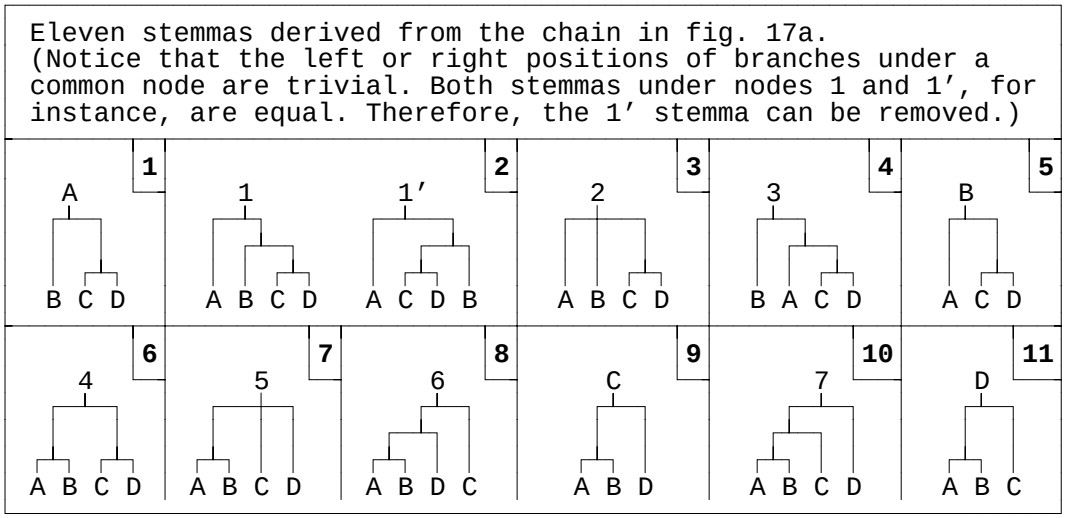

Figure 18. The eleven stemmas, derived from the (single) chain in fig. 17.

2.5. CURRENT UNIVERSAL TAXONOMICAL PRINCIPLES, BIOLOGICAL SYSTEMATICS AND CLADISTICS

2.5.1. TAXONOMICAL ORDERING STRATEGIES

Taxonomical methods (or: taxonomy) aim to classify elements (*taxons* or *taxa*) in taxonomical trees, like stemmas. These methods, amongst which the text-genealogical methods, face one fundamental question: which tools or taxonomical ordering strategies can be used to order the taxons? This question is not as trivial as it may look at first sight.

For instance, a biologist, who wants to order the living species genealogically, might think that the fact that some species have wings while others do not offers a good taxonomical feature; yet, it does not. The wings of insects and birds have developed in totally different ways. The fact that both flies and sparrows have wings does not mean that they have a common ancestor. In other words, the feature ‘wing-bearing’ is not a good taxonomical ordering tool. From this, we learn that *we must be selective when choosing the features for determinating genealogies*. Features which may look like excellent ordering tools at first sight do seldom survive closer examination.

Another example to illuminate the universal taxonomical problem to find good taxonomical features is offered by Renfrew (1989) and deals with the determination of the historical relationship of natural languages. The archaeologist Renfrew uses amongst others the English word ‘seven’ as a taxonomical ordering feature. The Dutch word is ‘zeven’, the Old German word ‘sibum’, the Latin word ‘septem’, the Greek word ‘hepta’ and the Sanskrit word ‘sapta’. These words show close resemblance. The Japanese word is ‘nanatsu’, which is totally

different. Renfrew now concludes that the Japanese language does not belong to the Indo-European family of a.o. the English, Dutch, German, Latin and Greek languages. Now, the central problem is, whether the use of the several words for '7' may be used to reveal language relationship. Notice that Renfrew's observations are not challenged here; they are only used to throw a light on thoughts behind genealogical research. Although it is unlikely, we may imagine that the ancient Japanese counting system was not decimal (using the numbers from 0 to 9) but, for instance, quintal (using the numbers from 0 to 4). In that case our '7' would be represented in the Japanese system by '12', which presumably leads to a different morphology. Some African tribes still use a quintal counting system. Thus, it would be inappropriate to use the occurrence of a word like 'seven' as a marker for language relationship.

2.5.2. Ordering or Clustering Taxons with Features

By now it should be clear that solid classification features are needed for ordering elements (*taxons* or *taxa*).

Imagine that we found six old wine glasses in a swamp. Then, suppose, that from all kinds of imaginary, non-existing studies would have appeared that we can order old wineglasses amongst others with the following ordering features: 'Foot-bearing' (a wineglass has a foot or not), 'Height' (glasses show different heights), 'Form' (glasses have square cups or round cups), 'Colour' (glasses are green or white) and 'Surface' (some glasses have drops of glass in the form of brambles or blackberries on the outside; other glasses have a totally smooth surface). We now examine the *states* or values of these five features in our wineglasses. The results of this investigation are printed in fig. 19:

	Foot-bearing (feature 1)	Height (feat.2)	Form (feat.3)	Colour (feat.4)	Surface (feat.5)
Glass 1	No foot	10 cm	Round	White	Brambles
Glass 2	No foot	12 cm	Round	White	Brambles
Glass 3	Foot	14 cm	Square	White	Brambles
Glass 4	Foot	16 cm	Square	Green	Brambles
Glass 5	Foot	18 cm	Oval	Green	Smooth
Glass 6	Foot	20 cm	Oval	Green	Smooth
	12:3456	1:2:3:4:5:6	12:34:56	123:456	56:1234

Figure 19. Matrix with six wine glasses, their features and their feature states.

At the bottom line of the matrix, feature relationship formulas are presented. They express how the states or values of the five features are distributed over the six taxons (in our case, the glasses). In these formulas, the sign ':' is used to denote the groups of taxons with the same feature state. The formula '12:3456', for instance, must be interpreted as: taxons 1 and 2 show one feature state ('no foot');

taxons 3, 4, 5 and 6 show another feature state (‘foot’). The formula ‘12:34:56’ concerning the Form-feature must be read as: glass 1 and 2 have one feature state, 3 and 4 another, and 5 and 6 yet another. The order of the groups of taxons (or sigla) with the same feature states in the formula is unimportant. The same is true for the order of the taxons within a group with the same feature state. The formula only denotes the clustered groups of taxons with the same feature states.

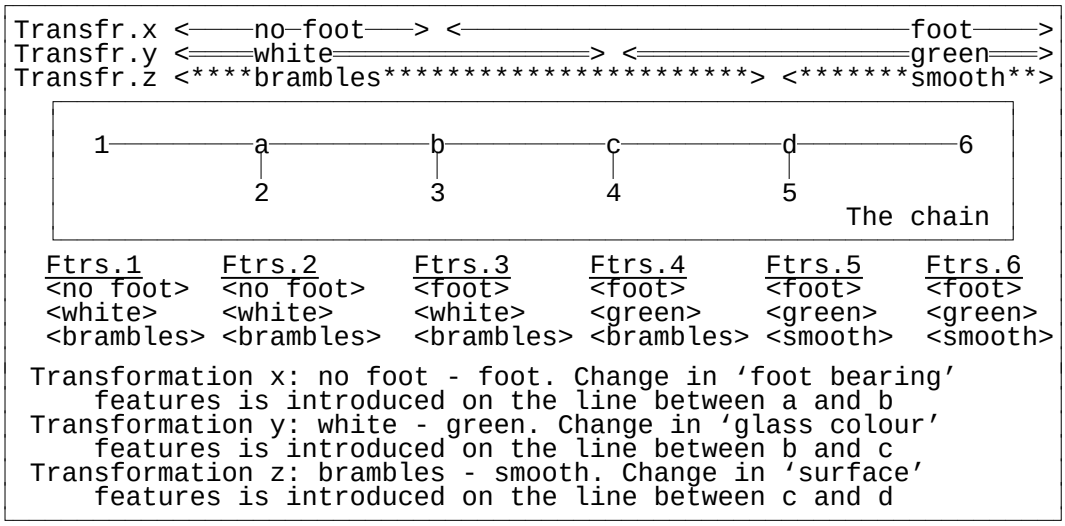

Figure 20. Three transformations of features lead to a network or chain.

In the matrix of fig. 19, we see that the features ‘foot-bearing’, ‘colour’ and ‘surface’ each have two feature states. With these *binary* (or *dichotomous*) features, we can build step by step a chain or relationship pattern of the wineglasses as presented in fig. 20. Each binary feature divides the group of glasses into two groups. Each group is placed on one side of the chain. In the chain in fig. 20 we see how the different binary features ({no-foot - foot}, {white - green}, {brambles - smooth}) lead to a certain order of the wine glasses 1 to 6.[18]

[18] The following chains are identical: their structure is the same because the ‘interconnected’ taxons show the same liaisons with each other. In each chain the groups 1-2-, 1-2-3-, 1-2-3-4- vs. the groups 3-4-5-6-, 4-5-6-, 5-6- can be found. Notice that the left-to-right and the vertical presentation of the taxons is unimportant, as long as the denoted groups are clustered together.

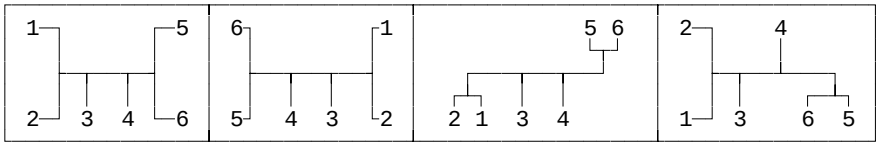

Figure 21. Four identical chains in different shapes.

In fig. 19, we see that the Form-feature has three possible states or values: ‘round’, ‘square’ and ‘oval’. Consequently, it is not a binary feature. The difficulty with such non-binary features is that they do not give us direct information on the ordering of the groups with the same features in the chain. The problem with the three ‘Form’-states which arise in the three groups 1-2-, 3-4- and 5-6- is, that it is not clear which group should take the middle position in the chain.

To determine which group should be in the middle, we need to know the *transformation order* of the three features, i.e. we have to determine how the feature states are distributed and how they developed into each other. The transformation order expresses the sequence in which a feature changes its character. Suppose that a colour feature is represented in four states: ‘black’, ‘white’, ‘dark grey’ and ‘light grey’. Now, the question is how these states transformed into one another. Assuming that the change of colour was smooth, it is likely that the transformation order was ‘white’-->‘light grey’-->‘dark grey’--> ‘black’ (or, vice versa: ‘black’-->‘dark grey’-->‘light grey’-->‘white’). Most often it is difficult to determine the transformation order of characters with more than two features. We conclude in text-genealogical terms that it is very difficult to build chains from complex variations, with three or more competitive variants.

Building chains from strictly binary (type-2) features is much more attractive, because then we are not confronted with this problem. The binary type-2 variant groups, end groups (see the end of §2.4.4) take their places undeniably at one end of the chain. When we use binary features, the research into the transformation order of the feature states is not necessary.

The chain expresses the logical relationship of the feature states which emerge in our taxons, the six wineglasses. A genealogy expresses how the strictly original feature states of the common ancestor of the taxons developed into the feature states of the known taxons. Therefore, the chain in fig. 20 is not at this point a genealogy or a stemma, because we did not take into consideration the originality of the feature states while constructing it.

One could propose that it is not necessary to know the transformation order of variants for a complex variation formula like AB:CD:EF. One could suggest, for example, that in this formula three groups A-B-, C-D- and E-F- occur and that each group has its own position in the chain, as is expressed in fig. 22. According to this view, the chain becomes a kind of *star*, with one central point, surrounded by several end groups. However, as we will see in §2.6.1.2, this proposition is not necessarily correct. Other chains are possible as well.

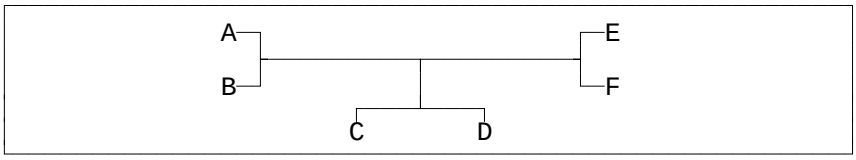

Figure 22. A ‘star’ chain for the variation AB:CD:EF.

Now that we have discussed some aspects of chains, we can create a genealogy or stemma from the chain in fig. 20. For the creation of a stemma from that chain, we must take into consideration the originality of some feature states. Suppose that we found out that the original feature state of the Foot-bearing-feature is ‘no foot’, which is present in the glass-taxons 1 and 2. Now, we can denote an original area ‘Or.1’ around the taxons 1 and 2 in the chain, as is pictured in fig. 23. Notice that we have drawn the Or.1 area as big as possible. It stops just before the area of glass 3. The reason for doing so, is that there might be lost wine-glasses on the lines in the chain. It is possible that on the horizontal line between the taxon groups 1-2- and 3-4-5-6- there was a glass 7, in which the original state ‘no foot’ existed. Because taxon 3 shows the non-original feature state ‘foot’, the Or.1 area has to stop just before the area of taxon 3.

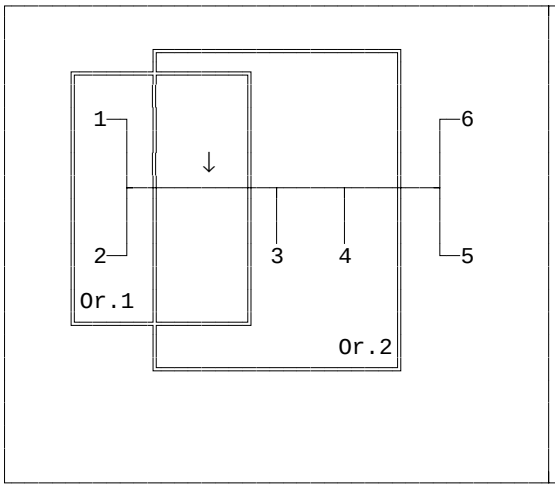

Figure 23. The point of orientation lies in the common part of the original areas of taxons 1,2 and 3,4,5,6.

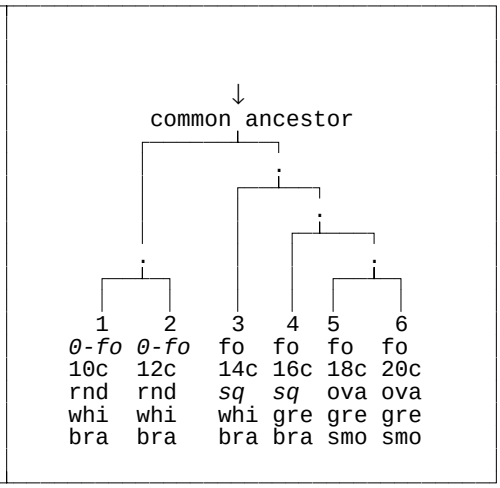


common ancestor
1 2 3 4 5 6
0-fo 0-fo fo fo fo fo
10c 12c 14c 16c 18c 20c
rnd rnd sq sq ova ova
whi whi whi gre gre gre
bra bra bra bra smo smo

Figure 24. The stemma, found by pulling up the chain at the point of orientation between original variants ‘0-fo’ and ‘sq’.

Now we examine the Form-feature carefully. Suppose, that this examination reveals that the feature state ‘Square’, present in glasses 3 and 4, is original. Again we draw, as big as possible, an area, now called Or.2, in the chain conforming this finding (also pictured in fig. 23). Notice that the order in which we draw the original areas is arbitrary. We could have started with the Form-feature and ended with the Foot-bearing feature.

We see that the ‘original areas’ ‘Or.1’ and ‘Or.2’ overlap in the area between taxons 1 and 2, and 3 and 4. In this common section of Or.1 and Or.2, the taxons with the two original feature states are located. Since the (lost) original common ancestor must have had by definition strictly original feature states, we know that the place of this original ancestor can be found in this common area. In fig. 23, this seems to be an empty area. But remember that on the lines of the chain lost

taxons can be imagined. The lost common ancestor with original features must be located in this 'empty' original area and is indicated by the arrow.

Now that we know the common ancestor's place in the chain, we can pull (*orient*, *direct* or *root*) it up at this common, most ancestral point in the chain. The result is pictured in fig. 24. It is the genealogy or stemma of the taxons. The idea behind the orientation of a chain into a stemma is simple. We have found a point on the chain with strictly original feature states. This point must be identical to the lost original common ancestor of the taxons. Since the common ancestor stands at the top of a stemma, we must attach the chain to that original point. This *point of orientation* in the chain is also known as the *root* of the stemma.

The stemma in fig. 24 is *oriented* (or *directed*, *rooted*) at the point of orientation in the chain, which is indicated by the arrow above the chain in fig. 23. When we look at the Colour-feature state 'white' in the stemma, we see that it occurs in taxons 1 and 2 to the left of the common ancestor and in taxon 3 to the right of the common ancestor. This can only be explained by the assumption that the common ancestor also showed the Colour-feature state 'white'. Similarly we find that the original Surface-feature state was 'brambles'.

2.5.3. SYSTEMATICS AND TEXT GENEALOGY

Thus far we have discussed several aspects of developing genealogical trees. We will now discuss how biologists develop genealogical trees of animals and plants to see whether we can profit from their genealogical ordering methods.

Systematics is the evolutionary discipline in biology that deals with the theory and practise of capturing the orderliness in nature. This orderliness has resulted from patterns of phylogenetic (*stemmatic*) ancestry and descent of *taxons*, or elements to be classified. In other words, systematics is the biological theory and practise of building genealogical trees: it is biological stemmatology.

Many parallels exist between biological and textual genealogy. Like text genealogists, biological systematicians struggle with the fundamental question which elements can be used to build trustworthy genealogies. Systematics can provide new perspectives and insights for text genealogy. The idea that text versions may be treated as biological taxons is not new.[19] Throughout the ages, biological taxons changed because ancestral characteristics were sometimes not

---

[19] See Platnick & Cameron (1977:380), as quoted in note 1 of Salemans (1987:191-192, see Appendix E of this study). See also Sober (1988:6): "The problem of *genealogical inference* is peculiar to historical sciences. A central example is the task of *phylogenetic* inference: how can we tell, for example, whether human beings are more closely related to chimps than they are to gorillas? However, it is not just species that have genealogies. Single organisms have family trees. Languages evolve and are related to each other by varying degrees of propinquity of descent. Ancient texts, copied by scribes whose copies are then copied, also are related genealogically. Indeed, social, political, economic and artistic traditions exhibit descent with modification (...) ."

transmitted fully to the younger generations. Similarly, texts have changed throughout the ages due to the intended and unintended alterations by copyists and printers.

Systematics and text genealogy share many fundamentals and notions. Unfortunately, many of these basic notions have different names in the two disciplines. In order to learn from systematics, it is necessary to become acquainted with certain terms. The systematic term *homology (in the broader sense)* implies, in text-genealogical terms, 'the phenomenon that text versions share the same textual difference or variant'. The systematic notion *strict* or *restricted homology* can be understood as 'the phenomenon that text versions share a non-original variant, a Lachmannian common error/change'. A *true* 'Hennigian' *monophyletic group*[20] of taxons possesses a common ancestor and contains all the descendants of that ('stem') species. It is an end group (see §2.4.4) in a chain. The text-genealogical concepts *parallelism* and *contamination* are known in systematics as *analogy* and *hybridisation*. When two taxons have an analogous characteristic, they show a similarity of form or structure which is not present in their closest common ancestor. The analogous characteristic has evolved independently in both taxons.

Within current systematics, three, not strictly monolithic, schools exist.

The first school is called *evolutionary systematics*. It builds genealogies from some (not all!) carefully chosen, trustworthy homologies in the broader sense, without analysing whether these characteristics are original or *derived*, i.e., non-original. Taxons are clustered according to the agreement of the homologies in the broader sense. Evolutionary systematics tries to filter out analogies. Because text genealogists like Dees and Zarri work with unanalysed homologies, their studies exhibit parallels with evolutionary systematics. Unlike evolutionary systematics, however, Dees and Zarri do not seem to oppose the use of analogies.[21]

The second school, *phenetics* or *numeral taxonomy*, clusters the taxons, often known as '*O*perational *T*axonomic *U*nits' or 'OTUs',[22] according to an index of the overall similarity of unanalysed homologies in the broader sense and of analogies. Most pheneticists believe that once enough features or characters have been examined the 'real' or 'true' resemblance will outweigh the 'false' resemblance due to parallelism. They claim that the *Law of great numbers* will minimize the influence of some false observations; if a large population is studied the effect of a few false observations will be minimized. Using statistical

---

[20] See also Salemans (1987:211), §3.3, offered in translation in Appendix E.

[21] See Dees (1975:4): "abstraction est faite de variations graphiques et de différences de déclinaison casuelle". Dees works with all kinds of variants, except for, as quoted, small spelling and declination differences. He does not analyze variants in order to avoid (other) analogies.

[22] The notion *O*perational *T*axonomic *U*nit (OTU) is used in phenetics (and cladistics) to indicate 'known animal, plant or species'. See also Salemans (1987:212) or §3.3.1 of Appendix E.

techniques, taxons with the most unanalysed characteristics in common are collected into groups. Phenetics is performed in text genealogy by, for example, Griffith, Galloway and, in the Netherlands, Brefeld[23]. One of the problems phenetics is confronted with is that taxons share many original, ancestral character values (in text-genealogical terms: original variants) that do not provide genealogical information. Genealogically distinct taxons run the risk of being grouped together incorrectly by statistical methods when these taxons share many ancestral character states and when these methods do not use not strictly type-2 variations.

The third school is *cladistics*, also known as *cladism* or *phylogenetic systematics*. It emphasizes that genealogies of taxons must be built from strictly genealogically informative elements: the true monophyletic groups. By classifying taxons into groups solely by their common ancestry, cladists try to filter out the analogies by analysing the characters or features.[24] The twentieth-century scientist Willi Hennig is considered to be the founder of cladistics. In cladistics, *cladograms*, our *oriented stemmas*, are often built from *networks* or *phylograms*, our *chains*. The Wagner network method is a cladistic method for building phylograms. In cladistics the phenetic overall similarity is not important. The differences between cluster and cladistic analysis is explained clearly by Lee (1987:2):

> Cladistic analysis is sharply differentiated from cluster analysis by that which it measures. Cluster analysis groups the objects being analyzed or classified by how closely they resemble each other in the sum of their variations, using statistical 'distance measures'. Cladistic analysis, on the other hand, analyses the objects in terms of the evolutionary descent of their individual variants, choosing the evolutionary tree which requires the smallest number of changes in the states of all the variants.

Roughly speaking, in cladistics all possible hypothetical trees of descent are developed in the first step. Secondly, the character or feature states are spread across these hypothetical trees. At this stage it is not important whether the character states are original or derived. Of all the possible trees the shortest, with the fewest changes of character states, is considered to be the best genealogical tree. This idea is based on the principle of parsimony (see §2.5.4). Taxons often share many character states. However, they still can belong to different families, or *monophyletic groups*, if they disagree on a few fundamental character states. Cladistics recognizes these different monophyletic groups correctly. More information on cladistics can be found in Salemans (1987), translated in Appendix E.

---

[23] See Brefeld (1994) and the review of this dissertation in Duinhoven (1995) and Salemans (1995).

[24] I claim that it is possible to recognize potential textual parallelisms. Therefore, we are only confronted with the one-headed monster of contamination.

2.5.4. CLADISTICS AND THE PRINCIPLE OF PARSIMONY

We will use the software package PAUP, acronym of *P*hylogenetic *A*nalysis *U*sing *P*arsimony, to build the text-genealogical tree of *Lanseloet van Denemerken* (see §4.4; in §2.5.5 we will demonstrate PAUP). The final 'P' of PAUP stands for 'parsimony', which deserves some extra attention. The principle of parsimony[25] or economy (Latin *parcere* = 'to save; to be economical') states that evolution takes the fewest possible steps, given the distribution of character states among taxons. To quote Swofford (1991:1):

> Parsimony methods search for *minimum-length trees* (...): trees that minimise the amount of evolutionary change needed to explain the available data under a prespecified set of constraints upon permissible *character* changes. The best known discrete-character parsimony method, often called *Wagner parsimony* (...), treats *binary* or *ordered multistate* characters and permits free irreversibility. Multistate character may also be left *unordered* (i.e., any *character state* is permitted to transform directly into any other state), sometimes called *Fitch parsimony* after Fitch (1971).

When two taxons show a common derived characteristic, the parsimonious explanation is that they go back to the same common ancestor with that characteristic. Shared genealogical character states are more likely to be due to common ancestry than to parallelism or contamination. The method of Lachmann, cladistics and other genealogical methods seek the shortest, most parsimonious tree that accounts the best for the disagreements and agreements in the corpus of variants or characters. Sober (1988) shows that the principle of parsimony is not as simple as it appears;[26] however, since there is no better alternative, as Sober will affirm, we choose to work with it.

2.5.5. DEMONSTRATION OF BUILDING A GENEALOGICAL TREE WITH PAUP

The software program PAUP, version 3, can be used for building text-genealogical trees from variation formulas. PAUP is software for cladistic analysis, created by Dr. D. Swofford. PAUP-3 (Swofford 1991) is only available

---

[25] See, among others, Sober (1988); Ridley (1986:61; 1986:189); Wiley (1981:20). See also Dearing (1974:10): "Greg was aware of the principle of parsimony (as we shall see, genealogical reasoning is impossible without this principle)."

[26] Sober (1988:x-xii): "...this method holds that a set of observations best supports that phylogenetic hypothesis that requires the fewest parallelisms and convergences. The question naturally arises as to what the use of this method assumes about the evolutionary process; does preferring parsimonious hypothesis presuppose that evolution proceeds parsimoniously? ... Are explanations that postulate fewer entities or processes to be preferred over ones that postulate more? Not always. Are common cause explanations always preferable to ones that invoke separate causes? Again, not always. ... Attempts to justify parsimony have not been successful, but neither have attempts to show that it is fatally flawed."

for Apple Macintosh computers. It contains many cladistic ordering features. Among others, it makes weighing variants possible. Here, we will focus on building cladistic chains, like Wagner networks, with PAUP.[27] PAUP is easy to use. Its results will be demonstrated with the variation formulas of seven French text versions A, F, G, H, P, S, and V of Chrétien de Troyes' *Yvain* as an example, as demonstrated in 1989 and 1991, and published in Salemans (1996).

Before we can run PAUP, the list (or *apparatus*) of the variants, developed at an earlier stage (and explained in Salemans 1996), has to be rearranged into the matrix in fig. 25. At the left of fig. 25, we see the variants. Since we use type-2 variations, these are always two competitive variants. At the right, the first variant is numbered as '0', the second as '1'. '0' and '1' are rather arbitrary. '0' is not intended to indicate 'original'. All that matters is that the group of texts with the same variant have the same number, while the other group of text with the competitive have the other number. Using the first variation as an example, the variant 'rat' occurs in texts A and F, while texts G to V have 'chat' or 'cat' there.

	A	F	G	H	P	S	V
1. "rat"|"c(h)at"	0	0	1	1	1	1	1
2. "pris"|"vif/uif"	0	0	1	1	1	1	1
3. "preus et uaillans/vaillans"	0	1	1	1	1	0	1
4. word ord. "sire yuains ... fu"	0	1	1	1	1	0	1
5. "trouai"|"entrai"	0	1	1	1	1	1	0
6. "apeleroie"|"estoit moie"	1	0	0	1	1	1	1
7. "murmur(r)e"|"parole"	1	0	1	1	1	1	0
8. "rois"|"cors/corz/cours/court"	1	1	1	0	0	1	1
9. "greva/greua"|"pesa"	1	1	1	0	1	1	0
10. "entrez"|"venus/uenus/uenuz"	1	1	1	0	1	1	0
11. p and v show no text	1	1	1	1	0	1	0
12. "contreual"|"(et) c(h)iet aval	1	1	1	1	0	1	0
13. "velues"|"mo(u)ssues"	0	0	0	1	1	1	1
14. w.o. "tant ... m aue2s/avez"	0	0	1	0	1	1	1
15. "pleuis"|"justis/iustis"	0	1	0	1	1	0	1
16. w.o. "puet ... set"	0	1	1	0	0	1	1
17. "souf(f)rir/soffrir"|"ferir"	0	1	1	1	1	0	0
18. "bleciez"|"plai(i)e2s"	1	0	0	1	1	1	0
19. inversion of verses (rh.words)	1	0	0	1	1	0	1
20. "dame"|"sire"	1	0	1	0	1	0	1
21. w.o."li ... rois/roys artus"	1	0	1	1	0	1	0
22. w.o. "mes armes toutes"	1	1	0	1	0	0	1
23. "paroit" | "auoit"	1	1	1	0	0	1	0
24. "ato(u)rna" | "monta"	1	1	1	0	0	1	0

Figure 25. *Yvain* formulas and matrix.

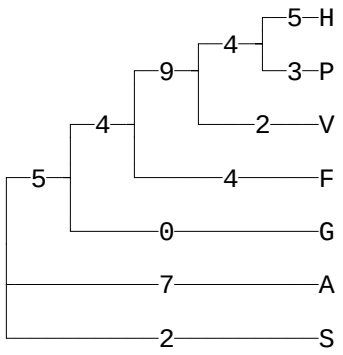
[27] Generally, MacClade (1992) is considered to be more convenient for output matters and for tracing characters/features or character/feature states. Often MacClade and PAUP are used together; PAUP is used for computing the shape of text-genealogical trees and MacClade develops pretty trees from PAUP's shape-descriptions. However, for simple genealogical trees like the *Lanseloet van Denemerken* tree PAUP offers enough facilities.

Then the matrix (fig. 25) is rebuilt into the so-called *NEXUS file format* as presented in fig. 26.

```
#NEXUS
begin data;
 dimensions ntax=7 nchar=24;
 format symbols = "01";
matrix
A  000001111111000001111111
F  001110011111001110000111
G  111110111111010110011011
H  111111100011101011101100
P  111111101100111011110000
S  110011111111110101001011
V  111101010000111100110100;
end;
```

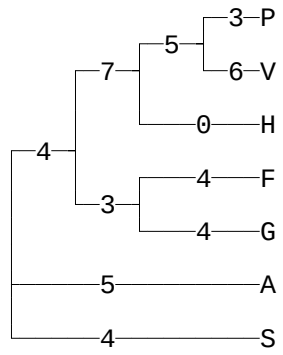
Figure 26. NEXUS-file derived from the *Yvain* formulas.

Taking the NEXUS file as printed in fig. 26 as input, PAUP will build figs. 27 and 28 within a few seconds, as is explained in chapter 2 of Swofford (1991).



First PAUP network/chain with shortest network length of 45. Notice that the branch of G has a zero-length, which makes G an intermediate node. A network is not a stemma yet.

Figure 27. First *Yvain* chain by PAUP.



Second PAUP chain with also a network length of 45. The PAUP software expresses that the first and second chain are equally possible.

Figure 28. Second *Yvain* chain by PAUP.

We see that the two phylograms in figures 27 and 28 differ considerably. The phylograms (or networks/chains) have to be oriented or rooted into a stemma later. This will not be shown here; the orientation of the stemma is demonstrated and discussed in Salemans (1996). In both figures, the numbers on the branches indicate the lengths or distances between two nodes in a chain or network. In an ideal situation, the branch lengths would be in accordance with the differences

between all the character states, '0' or '1' in this case, as pictured in figs. 25 and 26.[28] This happens when the character states are not contradictory. The ideal *minimum network length* for 24 characters with the states '0' or '1' is '24'.

PAUP has found in our *Yvain* case two minimum-length networks, pictured in figs. 27 and 28, each with a realized length of '45'. The *Consistency Index* (*CI*),[29] the quotient of the theoretical minimum network length and the realized minimum network length, is '24/45' or '0.533'. The CI of the most trustworthy network is '1', because then the realized tree and the theoretical minimum network have the same length. We will not discuss here when a CI can be considered consistent.[30] Possibly it is better, and at least more convenient, to work with the realized network lengths. The CI of '0.533' or the network length of '45' is not optimal. Clearly, some character states must be contradictory.

Around 1990, my theoretical text-genealogical insights and my software were rather rough or premature. The *Yvain* case was a first test to find out whether my theory and software were worthwhile, at that point of development. Happily, the results were promising and encouraging; PAUP managed to draw the commonly accepted *Yvain* stemma, as developed by Micha (1966:154). More about this *Yvain* case is presented in Salemans (1996).

---

[28] In fig. 26 we see that text version H has 24 character states with the values '111111100011101011101100'; P has '111111101100111011110000'. This implies that texts H and P have eight different character states or variants. Logically, the *minimum distance* (*m.d.*) between the two taxons is 8. We see that this *m.d.* has been achieved in both figs. 27a and 27b. When we compare the character states of texts G and P we see that they differ in twelve character states. In other words, the *m.d.* between G and P is 12. Neither in fig. 27a (distance G to P: 0+4+9+4+3=20) nor in fig. 27b (distance G to P: 4+3+7+5+3=22) has this *m.d.* been realized. The *m.d.* between A and G is 12, which has been realized in fig. 27a but not in 27b. The *m.d.* between F and H is 14, which has been achieved in fig. 27b but not in fig. 27a.

[29] See Salemans (1987:221) or §3.3.4 of Appendix E.

[30] Sober (1988:166-172) discusses Felsenstein's attempt to establish a sufficient condition for parsimony to be statistically consequential. Robinson & O'Hara (1992) used PAUP for the development of the text-genealogical tree of 46 manuscripts of the Old Norse narrative sequence *Svipdagsmal*. I share their enthusiasm about PAUP. Unfortunately, they do not discuss why the CI of 0.29 of their *Svipdagsmal* tree is acceptably high. (Our *Yvain* CI of 0.533 cannot be compared with this lower CI of 0.29, because the amount of Norse and French textual material differs.) Furthermore, they do not offer us a glimpse of their, undoubtedly huge, apparatus of variants as provided by the interesting Collate software package. See Maddison & Maddison (1992:114,269-271,278-284,367-368), for more information on the CI (Consistency Index), the EC (Ensemble Consistency), the RI (Retention Index) and the Rescaled Consistency Index (RC).

2.6. CLADISTIC IMPLICATIONS FOR THE METHODS OF LACHMANN AND DEARING

2.6.1. RECONSIDERATION OF THE LACHMANNIAN NOTION 'COMMON ERROR' AS FORMULATED BY MAAS; THE LIMITATION OF THE 'ZWEI ZEUGEN'

In §2.3 we stated that 'the' (nineteenth-century) method of Lachmann does not exist. It was formulated by later philologists who all agreed on one point: stemmas must be built with *common errors*. In the same section, I explained that I prefer to call them *common (derived) changes*. In Maas (1957:6f), generally considered as the study which explicitly expressed the Lachmannian rules, the Lachmannian *common error rule* is formulated as follows:

> Zeigen zwei Zeugen G und H gemeinsame Sonderfehler gegenüber allen übrigen Zeugen (...), so müssen beide von einer gemeinsamen Vorlage ε abstammen, von der die übrigen Zeugen nicht abstammen.

Lachmannians build their stemmas in one step with *common errors*. As explained in §2.4.4 and §2.4.5, the problem with the method of Lachmann is that it is difficult to determine whether or not something is an error (or derived change). As we know, 'modern' text-genealogists prefer to build stemmas in two steps. First, they develop the chain, which is the ground shape or deep structure of the stemma, with type-2 variations. Second, they orient a stemma from the chain. The advantage of building a chain with type-2 variations is that it is not needed to pass a judgement as to the originality of the variants concerned.

2.6.1.1. Lachmann's/Maas's 'Common Error Rule' is Only Correct as Long as the Variants are Part of Type-2 Variations

If we assume that text-genealogical trees must be built with the true groups of type-2 variation formulas (see fig. 10, §2.4.2 and §2.4.4), two elements of the common error rule are puzzling. Why does it explicitly mention 'zwei Zeugen' (two witnesses)? And what is meant with 'allen übrigen Zeugen'?

As we know, type-2 variations have two competitive variants, occurring in two true groups of texts. We know that a group consists of one or more texts, while a true group consists of two *or more* texts. The difference between 'our' type-2 variations and the variations mentioned in the Maas's is clear. We work with two true groups, each consisting of two or more texts. Maas seems to work with two true groups as well, but at least one of them must be a special group consisting of precisely two, and not more, texts: 'zwei Zeugen'.

I said 'seems', because 'zwei Zeugen (...) gegenüber allen übrigen Zeugen' is, perhaps, imprecise. It does not explicitly state that it deals with variants in type-2 variations. The problem is how to interpret 'gegenüber allen übrigen Zeugen'. If

Maas intended to say, 'all other witnesses, showing one other original variant', we agree with his rule, because the variants are only then in a type-2 environment. If he meant 'all other witnesses, regardless of their variants', we disagree. We feel that this imprecision in Maas's rule needs to be clarified by means of a more precise formulation. We must explicitly introduce the type-2 variation in it.

We already noted that Maas expressed that two witnesses must share a common error. In other words, the Maas's rule deals with a very *special kind of type-2 variation*: a type-2 variation in which one group contains precisely two text versions and the other group contains all the other texts. We call this *Maas's limitation of the two witnesses* (which will be discussed in §2.6.1.3.).

Now I will reformulate or expand Maas's rule, by replacing his special kind of type-2 variation with the more general type-2 variation. Notice that I just want to improve the rule, while preserving its original meaning or 'spirit'. The Lachmannian notion 'common error/change' is maintained:

> If a true group of text versions show the same common derived relevant change (or 'error') and if all the other text versions, a true group as well, together show one other (original) relevant variant reading, the text versions with the common change go back to an exclusive, immediate common ancestor, from which the other text versions do not derive.

or, more concisely, taking into consideration that we know the meaning of the notions *type-2 variation* and *true group*:

> In a type-2 variation, the true group of texts with the unoriginal, derived variants share one exclusive, immediate common ancestor (from which the other texts do not sprout).

The rule states that we can only use a common relevant[31] change as a stemma building element as long as the variation place in which it occurs does not show other common changes.[32] The new is more powerful, because it is not restricted anymore to a special type-2 variation with 'zwei Zeugen'.

We conclude that the method of Lachmann should not be called the 'Method of Common Errors' anymore, but, more restricted, the 'Method of Common Errors (or Derived Common Changes) *in Type-2 Environment*'.

---

[31] The word 'relevant', introduced in §2.1, means that the variance may not consist of a trivial difference in spelling or another parallelism.

[32] The group of text versions which show the same common change is monophyletic: all the members of the group go back to the same common ancestor, in which the change was introduced; all the descendants of that ancestor possess this change. See Salemans (1987:§3.3), presented, in translation, in Appendix E.

2.6.1.2. The Problem of Building Chains from Complex, Non-type-2 Variation Formulas like AB:CD:EF

The previous section began with: 'If we assume that text-genealogical trees must be built with the true groups of type-2 variation formulas ...'. The aim of the current section is to demonstrate the importance and the advantages of working with type-2 variations and the problem associated with using groups of complex variations as tree building elements.

Many philologists seem to have been confused by Maas's common error rule. They do not mention the 'zwei Zeugen' nor the 'type-2 variation' when they present, demonstrate or explain the method of Lachmann, as formulated by Maas. If we study text-genealogical studies, we often see that the common error rule has been (mis)interpreted as follows:

> When manuscripts show the same common change they go back to the same common ancestor (which is not an ancestor of the other manuscripts)

This conforms to the rule as offered by Froger (1968:41) ('Le principe (...) est donc: «la communauté des *fautes* implique la communauté d'origine»') and other scholars like de Haan.[33] In other words, they express that it is enough to find 'common errors' to build stemmas, regardless of whether these variants are part of type-2, type-3 or type-4 variations. At this point, I intend to propose that this simplified Lachmannian common error rule, without the element of the type-2 variation in it, is inaccurate and even dangerous. Many inaccurate stemmas will have been built with 'non-type-2 common errors'.

Let us study the assumption that stemmas can be built in a Lachmannian way with all kinds of derived common changes, and not strictly with derived common changes occurring in type-2 variations. We use an example with six text versions A, B, C, D, E and F.

Suppose that the stemma in fig. 29 is correct. At this stage, we disregard the readings which are placed under the sigla A to F. They will be discussed in conjunction with fig. 30. Now, we can build (in my view: incorrectly) a stemma in a Lachmannian way from variants which are part of complex variations. Suppose that texts A to F show at a first variation place two different ***n***on-***o***riginal readings (common changes or errors) 'no1' and 'no2' and the ***or***iginal reading

---

[33] See de Haan (1977:255): 'de handschriften worden in een stamboom (*stemma*) gerangschikt, waarbij hun familierelaties worden bepaald door vergelijking van fouten die ze met elkaar gemeenschappelijk hebben'. In English: 'the manuscripts are ranged into a family tree (*stemma*), in which their family ties are determined by the comparison of the errors which they have in common'. Not a word is spoken about the fact that the other manuscripts which do not show an error/change, must all have the same (original) reading; furthermore, Maas's two witnesses ('zwei Zeugen') are not mentioned by de Haan. See also Willis (1972:13-32).

'or1'[34]; A and B have 'no1', C and D 'no2', and E and F 'or1'. At a second variation place A, B, C and D show a common change 'no3', where E and F have the original reading 'or2'. At the third variation place A, B, C and D have the original reading 'or3', while E and F have common change 'no4'. The accompanying formulas are: (1) AB:CD:EF, a complex variation (type-4); (2) EF:ABCD, a type-2 variation; (3) (again:) EF:ABCD.

Violating our own expanded Lachmannian rule, which forbids us to use common changes of complex variations as stemma building tools, we argue as follows. Since A and B show common error ('no1') at variation place 1, they must have a common ancestor 'w'. At the same variation place, C and D share common error ('no2'), leading to common ancestor 'x'. The second variation place teaches that A, B, C and D have the common error 'no3', resulting in ancestor 'y'. From the third variation place, we learn that E and F share common error variant 'no4', which gives rise to ancestor 'z'. In fig. 30, the accompanying stemma is pictured.

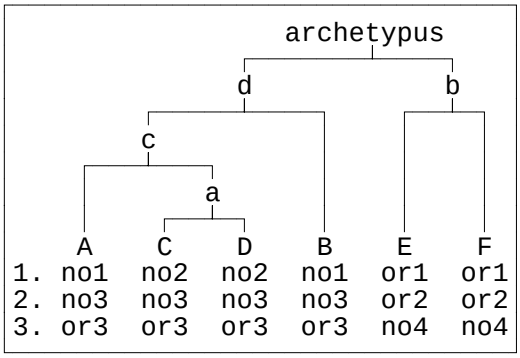


Figure 29. Presumed correct stemma of texts A to F.

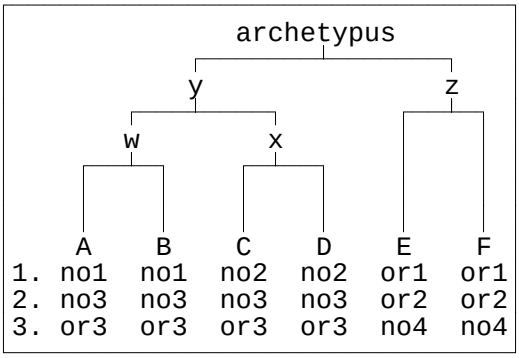

Figure 30. Incorrect stemma of texts A to F, built with the groups of formulas AB:CD:EF and ABCD:EF.

Evidently, both stemmas differ. Notice, however, that they both cover or express the variation formulas AB:CD:EF and ABCD:EF correctly. The main difference is that in fig. 30 A and B have an *exclusive, immediate common ancestor* ('w'), from which the other text versions do not derive. In fig. 29, A and B share a common ancestor ('d') as well. But other text versions derive from this ancestor ('d') too. 'd' is not an immediate and exclusive common ancestor of A and B.

[34] Of course, it is not necessary that the original variant has been delivered to us. Therefore, the notion *original variant* can be understood as well as 'archetypus variant' or 'the variant most close to the original variant' or 'the less erroneous variant'. Looking at all the competitive variants, the (most) original variant is the one which may be considered to be the reading which was present at the start of the transformation process during which the other variants developed.

Why is it difficult or dangerous to build a stemma from variant groups of complex variations? The fact that a (true) group of two or more texts in a complex variation share a derived variant, does imply indeed that these texts share a common ancestor. However, in a complex variation the difficulty is that this ancestor does not necessarily have to be the exclusive ancestor of these texts. In other words, a true group in a complex variation is not necessarily an *end group* (see §2.4.4), with which chains and stemmas can be built. For the development of stemmas, we can only use exclusive ancestors and the groups of texts that derive from them. This problem does not occur when we use type-2 variations, because we know that groups in these variations are always end groups (in the chain).

I do not claim that Lachmannians are obligated to use strictly common changes/errors which are part of type-2 variations. In §2.5.2, we discussed the importance of the transformation order of characteristics in complex situations. Looking at fig. 29, we see that the text group with the 'last' common error is the end group with an exclusive ancestor. Therefore, if Lachmannians are confronted with a complex variation, and if they determine the transformation order of the variants correctly (namely: 'or1' --> 'no1' --> 'no2'), they can use the group of texts with the last common error/change (here: 'no2') as an end group in the stemma. It is often difficult to determine the *transformation order* of variants, but it is not impossible. Suppose, for instance, that texts A and B in fig. 29 have at a certain variation place 'coninghinne' ('queen'), C and D have 'hertoghinne' ('duchess'), and E and F have 'coninc' ('king').[35] We imagine that a Lachmannian will determine the transformation as follows: first 'coninc' --> then 'coninghinne' --> lastly 'hertoghinne'. Texts C and D have the last common error, which means that they must be an end group. If philologists are able to find the last common change in transformation orders, they can use complex variations for the development of stemmas. If they are unable to analyze transformation orders, all they can do is to stick to the simple type-2 variations.

So far, we have studied the danger of groups in complex variations from a Lachmannian point of view, without paying attention to the chain. We will now look at the use of (true) groups in complex variations for the development of chains.

Is the chain for the variation formula AB:CD:EF always a *star* (see fig. 22)? We use figs. 31 and 32 to find the answer.

[35] I thank Dr. A.M. Duinhoven for this example.

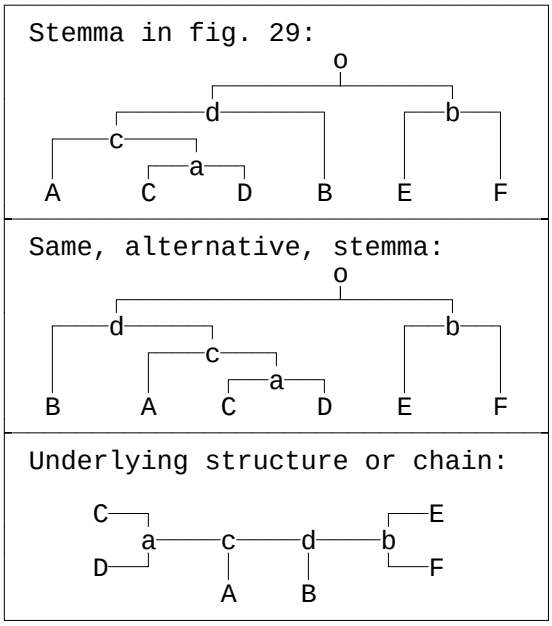

Figure 31. One possible stemma for the variation formula AB:CD:EF, together with its chain; A-B- is not an end group here.

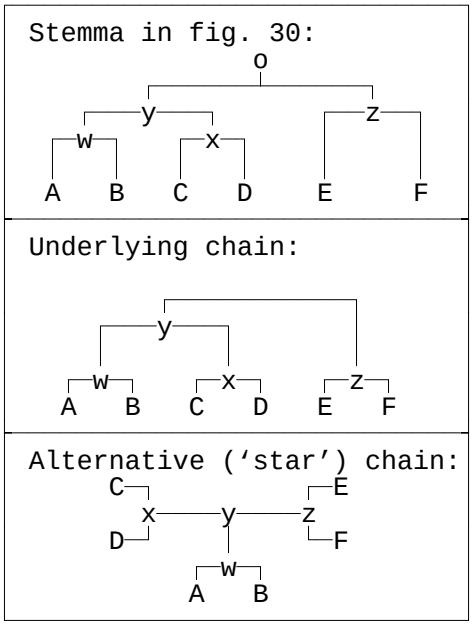

Figure 32. Another possible stemma for formula AB:CD:EF, together with its ‘star’ chain; here, A-B- is an end group.

Both stemmas cover or express the variation AB:CD:EF. But the stemmas are different, as are their chains. In other words, a formula like AB:CD:EF is not necessarily explained by a *star* chain (fig. 32) only, with one central point surrounded by end groups. Other chains, like the one in fig. 31, are possible too. In fact, many different stemmas and chains can be developed for the formula AB:CD:EF, although we will discuss them in this study.

Notice that true group A-B- is an end group in fig. 32, while it is not in fig. 31. Logically, a true group of a complex variation is not necessarily an end group in a chain or stemma. In other words, it is difficult, if not impossible, to determine the precise position of a true group in a chain or stemma if this group is part of complex variation. For the development of text-genealogical trees, we prefer to work with true groups in type-2 variation formulas, since the place in a chain of (only) these true groups is always clear. Genealogical methods that do not recognize the difficult status of true groups in complex variations often produce incorrect chains and stemmas. (This discussion will be continued in §3.2.4.)

2.6.1.3. The ‘Zwei Zeugen’ Element Reconsidered

We wonder why Maas mentioned ‘zwei Zeugen’ in his common error rule, quoted at the start of §2.6.1, instead of ‘zwei oder mehr Zeugen’ (two or more witnesses)? One could claim that Maas of course intended to say ‘zwei oder

mehr'. If three or more texts share a common change (in type-2 environment) this implies that these 'three or more texts' share a unique common ancestor, which is not the ancestor of the other texts. Yet, the fact is that Maas explicitly mentions 'zwei'. Did he have a good or special reason for doing so? I think he did.

Let us reconsider how Lachmannians build stemmas. We use common derived changes in type-2 environment, because only these changes enable us to detect immediate and exclusive common ancestors of texts. Suppose now that we have detected a common derived change in type-2 environment in three texts A to C (which are supposed to be end nodes), while six texts A to F have been delivered. We conclude that texts A, B and C share a unique, exclusive and immediate common ancestor in the stemma. Unfortunately, the structure within this group of three is unclear. There are several possibilities, as pictured in fig. 33:

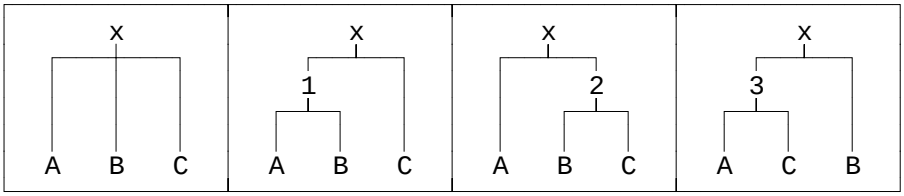

Figure 33. If we know that three texts share an exclusive and immediate ancestor ('x') several possible stemmas can be drawn.

The possible stemma parts have in common that the three texts share a unique and exclusive forefather 'x'. However, the structure within the group with ancestor 'x' is unclear. The three texts go back to one forefather, either A and B share a common ancestor '1', or B and C have a common forefather '2', or A and C have a common ancestor '3'. This problem does not occur when we find a common error in a type-2 environment occurring in precisely two texts. Then, there is only one possible shape, in which both texts go back to the ancestor immediately above them. It is likely - if an interpretation is allowed - that Maas chose for the 'zwei Zeugen' element in the common error rule for that reason.

The only remaining question is how is it possible to build stemmas with the limitation of groups consisting of precisely two texts ('zwei Zeugen'). Actually, the procedure is rather simple. First, we try to find as many as possible common derived changes in type-2 environments and occurring in precisely two texts. This results in a list of groups with two texts that share a unique, exclusive and immediate ancestor. We call this list 'list-2'. Second, we build a 'list-3' for groups of three texts, a 'list-4' for four texts, etc. Suppose that in list-2 a group of two texts A-B- occurs and in list-3 a group of three texts A-B-C-. From the list-2, we know that A and B must have an immediate ancestor, '1'. We can draw a small part of the stemma, for texts A and B, with their common ancestor '1' above them. Then take group A-B-C- from the list-3 group. We already know that A and B have a common ancestor '1'. Therefore, we may consider group A-B-C- to consist of actually two texts: common ancestral text '1', representing texts A

and B, and text C. In other words, we rewrite the list-3 group A-B-C- as a list-2 group 1-C-, substituting A-B- for their forefather '1'. The group 1-C- consists of two texts '1' and 'C', and we know that both texts go back to a unique, immediate forefather. Now we can draw another part of the stemma (see the second stemma in fig. 33).

In fig. 12, an algorithm was presented for building chains from type-2 variation formulas. It works with the same principle. We start with the relationships within small groups (see step 3: 'Take the smallest group of the list of type-2 groups') and then add information derived from larger text groups to it. (See also figs. 13a to 13h.)

2.6.2. A CLADISTIC EYE-OPENER FOR LACHMANNIANS: ROOTED AND UNROOTED TREES

Cladists build genealogies from true monophyletic groups, just like Lachmannians build their stemmas from common changes. Both methods, the biological and the philological, are criticized for the same reason, which is that it is difficult or impossible to determine whether a variant or characteristic is derived or original. Cladists discovered that these judgements about originality are often unnecessary. As explained in §2.5.2, they claim that with the knowledge of how the characteristics - our philological variants - changed, *unrooted or undirected trees* (*phylograms* or *networks*) can be built. These trees can be oriented into *rooted or directed trees* (*cladograms*). Modern text genealogists have been acquainted for decades with unrooted and rooted trees. They know them under the names *chains* and *stemmas*. However, most modern text genealogists present their chain-to-stemma methods as being totally different alternatives for the method of Lachmann, in which chains and stemmas are not clearly distinguished. The innovation or eye-opener is that the concepts of these unrooted and rooted trees can be incorporated into the method of Lachmann.

One may wonder why I defend the method of Lachmann and even try to improve it. The reason is that method of Lachmann and the cladistic method of building genealogies are very much alike. With a few adaptations, the method of Lachmann could regain its position as one of the leading text-genealogical methods, as it would agree with sophisticated taxonomic ordering theories. What I particularly like about Lachmannians is that they choose their ordering tools, their *derived common changes*, very carefully. Admittedly, some of their judgements as to the originality of variants are obsolete, since these judgements are not necessary for building chains. However, their general consideration of whether or not a variant can be used for the development of text-trees is still necessary. For me, that is the heart of the method of Lachmann. Many modern text-genealogists, anti-Lachmannians, are not hindered by such considerations. They simply use most of the variants for their text-genealogical purposes, which is in principle incorrect.

2.6.3. CRITICISM OF DEARING'S WAY OF ADDITIONING VARIATIONS

Greg's method, also known as Greg's Calculus, as formulated in his *Calculus of Variants* (1927), cannot deal with the problem that arizes when there are not enough type-2 variations to draw the stemma (see step 3c of the algorithm in fig. 12). Practise teaches us that the more text versions are delivered, the less the chance that we will find type-2 variations. For example, when five text versions are delivered, we have a fair chance of finding three text versions with one variant and the other two with the second variant. When ten text versions are delivered, it is more difficult to find two opposing true groups with precisely two competitive variants covering all the text versions. In that case, more type-3 and type-4 variations will occur. This is a serious problem, since type-2 variations are the fundamental building stones of chains.

In §2.6.1.2, we discussed the difficulty of building chains from complex, non-type-2 variation formulas like AB:CD:EF. We saw that it is very difficult to determine the end group in a complex variation formula for the development of the chain. The modern 'chain-to-stemma' text-genealogist Dearing (1974), who used Greg's work (1927) as a starting point for his own text-genealogical ideas, claimed to offer a solution to this problem. He developed a method to find type-2 (end) groups in complex variations; it generates new simple variations from complex variations by 'additioning' variation formulas.[36]

It is not easy to understand how Dearing's additioning algorithm works, because he did not elaborate it in clear algorithmic steps. However, the explanation is not really necessary, since the algorithm is incorrect. It can produce incorrect new type-2 variations. Unfortunately, this implies that the problem of the shortage of type-2 variations in Greg's Calculus is still unsolved.

Dearing (1974:71) claimed that the sum of the complex type-4 variation formulas (see fig. 10) AB:CDE:F and A:B:CD:EF equals the type-2 variation formula AB:CDEF. We can falsify the way he adds up complex variations if we can draw a tree in which both denoted type-4 variations are found, but in which the newly created (*synthetic* or *artificial*) type-2 variation cannot be asserted. Such a 'falsifying' stemma is displayed in fig. 34. We do not discuss how this stemma was designed and simply assume that it is correct.[37]

---

[36] Dearing (1974) draws a chain using only the smallest groups of type-2 variations. This approach is also used in the algorithm in fig. 12. When Dearing finds a type-2 variation formula as ABC|DEFG, he uses only A-B-C- for the development of the chain. He does not explain why the larger group D-E-F-G- may not be used. Possibly, this is a normal mathematical procedure, but I mistrust it a bit. To put my doubts into cladistic terms, the larger group might be an informative, monophyletic, (end) group, too.

[37] The chain of the stemma can be built with type-2 variations CD:ABEF, AF:BCDE, CDE:ABF. Suppose that the variation CDE:ABF is found twice, and that we judge that in one variation C, D and E, and in the other variation A, B and F have the original reading. Then, we know that the chain has to be oriented between the groups A-B-F- and C-D-E-. One could suggest now that we do

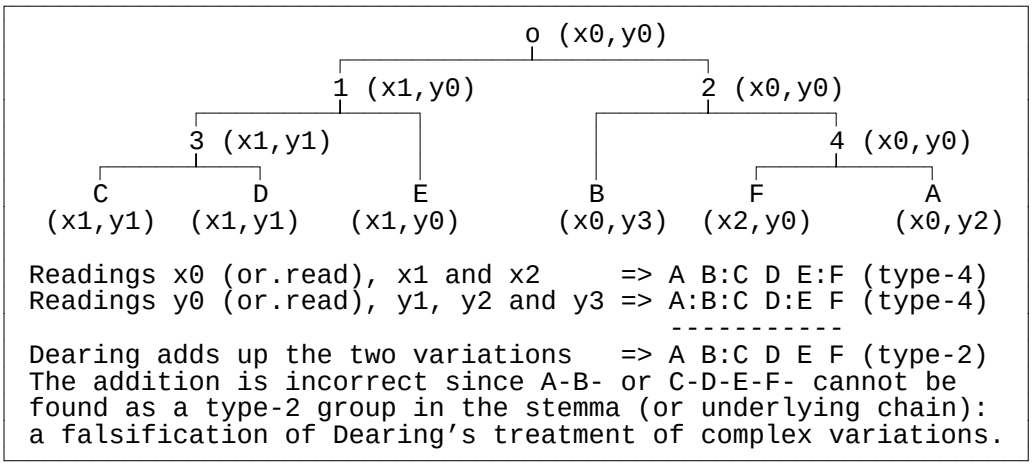

Figure 34. Falsification of Dearing's additions of complex groups.

In fig. 34, we see six manuscripts A to F and intermediate nodes o, 1, 2, 3 and 4. Each node is accompanied by two readings at two variation places x and y. The original readings of these variation places are 'x0' and 'y0'. The derived, non-original readings are 'x1' and 'x2', and 'y1', 'y2' and 'y3'. We see, for example, that manuscript A has the original reading 'x0' and the derived reading 'y2' at the two variation places. The variation formula for the x-variation is: AB:CDE:F, since A and B have 'x0', C, D and E show 'x1', and F reads 'x2'. The y-variation formula is: A:B:CD:EF. As stated above, Dearing claims that both variation formulas lead to the new variation AB:CDEF. This is incorrect: the groups A-B- and C-D-E-F- cannot be found in the stemma (or the chain). We conclude that the treatment of complex variations is incorrect in this matter.

As stated, it is difficult to answer the question why Dearing's treatment does not work well, since he does not explain it. However, the heart of his approach is to combine sets or groups of texts versions into new (bigger) sets. The possibilities to combine sets or groups of text versions are much more limited than Dearing suggests. These combinations may lead to false, unwanted conclusions.

In §2.3, we saw that original common variants are explained by the fact that text versions derive from one and the same original text. Therefore, only derived common changes offer information about the shape of a text tree. Original readings can occur almost unpredictably in text versions. The fact that a set or group of text versions share a common original variant does not have any text-genealogical value. The difference between original and derived variants is not important, when they occur in simple, type-1 and type-2, variations.[38] However,

not need the additioning of the complex variations, since the type-2 variations provide enough information. The point is that Dearing's method of adding up complex variations has to be correct, regardless of the question whether or not we have enough simple variations to draw the chain.

[38] When we use simple variations, i.e. type-1 and type-2 variations, for the development of a chain, we

in complex variations, groups of text versions occur that share original variants. These original groups are not necessarily a (part of an) end group in a chain. We can say that they have an *empty* or *meaningless* text-genealogical value. The danger of Dearing's approach is that he combines one or more of such meaningless groups into new groups. Once we know this, it is quite easy to find a stemma, like fig. 34, to falsify Dearing's system of combining complex variations into simple variations. All we have to do is to show that a group like A-B- which is meaningless in text-genealogical terms when used by Dearing in his additioning approach. Perhaps, other groups in complex variations, without an exclusive common ancestor, are meaningless as well text-genealogically speaking.

The lesson is the same as in §2.1.6.1: if we want to avoid difficulties, we should avoid using complex variations. (True) groups in complex variations are not necessarily end groups, while (true) groups in type-2 variations are. If we cannot determine which (true) groups in complex variations are end groups, we must stick to use the true groups in type-2 variations. This severe limitation, the *type-2 limitation*, will be discussed and critized in §3.2.4.

We must fear that much text-genealogical research and many stemmas have to be reconsidered. Dearing, for instance, applied his influential method to research into the relationships of versions of Biblical texts. Now that we know that his method contains incorrect elements, it is probable that his Biblical stemmas are incorrect. This may have severe consequences for the efforts to recover original Bible texts or fragments. According to me this demonstrates well enough the substantial implications of text-genealogical for society. If we want to recover original Bible fragments, we must use trustworthy text-genealogical methods.

2.7. THE MINIMUM NUMBER OF THREE OR FOUR TEXT VERSIONS

If we build chains and stemmas with type-2 variations, with two true groups, at least four text versions are needed. If we use type-1 variations as well - see §2.4.3: it is not forbidden to use them -, like we will do in the case of the *Lanseloet van Denemerken* tree in §4.7.3, the minimum number is three.

Sometimes text-genealogical methods have been criticized on this point. The Dutch philologist Jonckbloet[39], for instance, complained that we need about (!) five text versions to be able to apply the method of Lachmann. He argued from a pragmatic point of view that text-genealogical methods are more or less worthless for medieval Dutch or Flemish texts. It is true that many medieval Dutch or Flemish texts have only one or two still existing text versions. However, the

---

place the text group with the same common derived variants on one side of the chain and the other group with the original variants on the other side of the chain. Then, it is not necessary to analyze which variant is original or which is derived.

[39] See Jonckbloet 1846, as mentioned by de Haan (1977:260).

suggestion that text-genealogical methods are worthless, is simply incorrect. To make a comparison: a Swiss scientist could criticize a Dutch study on adapting Dutch sea-dikes (because the sea-level is expected to rise in the future). This scientist could say that the Dutch study does not have any value, because Switzerland does not have any contact with the sea. Obviously, this would be a shortsighted view. If a theory cannot be applied in all situations, this does not imply that the theory is worthless.

2.8. A Simple Advice for the Study of Contamination

If a copyist uses two or more (parts of) text versions as his sources, the resulting new text version is a contaminated text. This bastard text shows characteristics of several text versions, by which it becomes very difficult to develop text-genealogical trees. In §3.2.1 (see fig. 37b), we will examine contamination further.

In the past decades, contamination has been a hot topic in text-genealogical studies. When text-genealogists are confronted with *contradicting* (or *bias*) *variants*, they, generally, explain them by assuming that they were caused by contamination. Therefore, they focused on the question how to detect or recognize contamination and how to build text-genealogical trees from contaminated texts.

In the process of building trees, it is quite possible that errors can be made by text-genealogists. In §2.6.1, we saw that a Lachmannian common change may only be used as stemma building stones under strict (type-2) conditions. In §2.6.3 we saw that it is incorrect to combine complex variations into new type-2 variations. In other words, the *bias* of contradicting variants may be caused by the incorrect application of tree building methods. Furthermore, as we will see in the next chapter, modern computerized text-genealogists (i.e. people who use computers for text-genealogical purposes) often do not pay much attention to the quality of the variants. They trust that their software is able to filter out some bias in the variant materials. Sometimes the bias is explained by contamination. However, if the quality or trustworthiness of the variants is low, the contradictions in the variant material may be caused by the use of incorrect variants. Of course, we do not claim that contamination does not exist, but contamination is too often used as a *black box* explanation for bias in the variant material.

My small contribution to the study of contamination is, therefore, a simple advice to text-genealogists. If variants point towards contradictory genealogical relationships, we first have to investigate whether the method we build our tree with is correct and whether our variants are truly genealogical (in the sense that they reveal genealogical relationships). We can only start thinking of contamination if we are sure that our method and the utilized variants are trustworthy. Perhaps this simple advice is disappointing for scholars studying the phenomenon of contamination, because it does not help to solve the problem of

contamination. Nevertheless, it is useful for the observation of contamination. We must be sure that we study real contamination and not the hopeless result of badly chosen variants.

2.9. CONCLUSION AND SUMMARY

In this chapter, several methods for building genealogies have been presented.

We saw that the method of Lachmann, dating from the nineteenth century and (re)formulated in 1957 by Maas, depends heavily on the detection of common *errors*. We prefer to call them common (derived or unoriginal) *changes*, because the term errors has a negative connotation. The problem with the method of Lachmann is that it is often very difficult to determine whether a variant is original or unoriginal. This determination is sometimes very subjective and beyond scientific control or justification. Furthermore, we discussed how the Lachmannian common change can be used as a tool to build stemmas. Many philologists have claimed that a common change in texts indicates that these texts have the same unique common ancestor. We saw that this claim is not completely correct and fear that many false 'Lachmannian' stemmas have been developed. A common change can be used to build stemmas, but only under special circumstances. These circumstances are as follows: the common change must occur in two or more texts, while all the other texts have a single other variant in common. In other words, a common change is only useful as a stemma building tool if it is part of a type-2 variation.

The modern system of developing a stemma in two steps, as proclaimed by Greg (1927), Dearing (1974) and many others, offers an attractive alternative for the problem with the method of Lachmann that variants must be judged as to their originality. According to this modern system a chain is first developed from variants, *unjudged* as to their originality; then a stemma is derived from this chain with the use of only a few judgements about the originality of some variants. For the development of a chain Greg and Dearing show that, as a rule, only variants in simple variations, especially type-2 variations, can be used. In a type-2 variation, we deal with precisely two competitive variants; each variant must occur in at least two text versions. Complex variations, with three or more variants, cannot be used for the development of chains. This type-2 limitation is a severe limitation. Dearing (1974) claimed that complex variations can be combined into simple variations. Unfortunately, it has been demonstrated that this claim is false. In other words, the type-2 limitation still exists.

Genealogy, the taxonomical art of building genealogical trees, is not only performed by text-genealogists. Biologists have been studying the family relations of animals and plants for centuries. In order to open our eyes to our own text-genealogical limitations, we took a look at how biologists develop their trees. We became acquainted with the school of pheneticians, who work with statistical/

mathematical, inductive methods. We also met the currently influential cladists. Cladists build their trees in two steps: from a deep structure - *phylogram*, our chain - to a surface structure - *cladogram*, our stemma. This agrees with the accepted modern, post-Lachmannian, method of developing stemmas promoted by Greg, Dearing and others. On the other hand, cladists pay much attention to the relationship-revealing power of characteristics - our variants. They consider very carefully whether they may use a characteristic as a tool to build a genealogical tree with. The cladistic school is not inductive, but deductive. First, cladists formulate hypotheses on the relationship-revealing qualities of characteristics; second, they apply them, which results in family trees; third, they evaluate the hypotheses. In this careful consideration of the value of characteristics, we recognize the method of Lachmann, which 'judges' the quality of variants as well. The often disrespected (textual) Lachmannians and the esteemed (biological) cladists are quite alike, and they could learn from each other. Lachmannians, for instance, could incorporate the *chain* concept of the cladists in their method.

The school of cladism, in short: *cladistics*, offers a bridge between the traditional Lachmannians and modern chain text-genealogists. One well-known cladistic software package is PAUP. A few years ago, I used PAUP successfully to draw the text-genealogical tree of a part of Chrétien de Troyes's *Yvain*. We will use PAUP as well to develop the *Lanseloet* tree.

Sometimes text-genealogical methods are criticized, because they can only be applied if three or more text versions are present. This criticism is a bit peculiar. The fact that a theory cannot be applied in all situations, does not imply that it is worthless. Furthermore, we considered the problem of contamination and the danger of using contamination to explain contradictory variants. It is possible that the contradictions in the variants are produced by an incorrect choice of variants.

3. TOWARDS A NEW TEXT-GENEALOGICAL METHOD

3.1. INTRODUCTION

A few years ago, I hoped that it would be easy to develop the pedigree of the fourteen *Lanseloet van Denemerken* text versions with the knowledge presented in chapter 2. I wrote a computer program that generated a synoptic (or score) *Lanseloet* text edition, with more than thousand blocks of fourteen verses. Each block contained one verse from each text. I started to note down in a list the variants that could be used to develop the *Lanseloet* chain and the stemma. As we saw in §2.3 and §2.4.5, the method of Lachmann has often been criticized because of its unverifiable subjectivism. There was not a clear system to determine whether a variant was original or derived. I felt obligated to create a consistent and clear system for accepting or rejecting variants.

The problem with building a list of *Lanseloet* variants was two-headed: a. I needed a clear list of characteristics or types of variants by which I could 'judge' which *Lanseloet* variants were suitable for building a genealogical tree; b. the rejection or acceptation of the variants had to be performed consistently, according to the list of characteristics and concerning all the variants.

Let us discuss the first problem. A few years ago I did have a vague idea about how to discriminate false and good variants for building a *Lanseloet* tree, but I needed clear criteria. Therefore, I started to (re)read several text-genealogical studies. Unfortunately, they did not offer the description of text-genealogical variants I was looking for. Most modern text-genealogists did not pay attention to the way they detected their variants for building text-genealogical trees. This was astonishing to me, because these genealogists, on one side, blamed Lachmannians for their unverifiable subjectivity, and, on the other side, they did not offer any insight into the way they worked with variants. I concluded that I had to build the list of characteristics of relationship-revealing variants myself.

The second problem of a few years ago was that, even if I could make a list of characteristics, I probably could not use it consequently to check all the thousands of *Lanseloet* variants without forgetting variants. (Of course, this problem is not strictly connected to deductive text-genealogical research; inductive, *mathematical*, text-genealogists are also obligated to detect all the useful variants in a consequent way.) To resolve this problem I decided to use the computer, because it could process all the variants according to the list of characteristics, without making mistakes as humans would. It was a thrilling thought to teach or train the computer to recognize or test the *quality* of variants according to a list of characteristics. If I was successful, the computer would be able to execute a deductive text-genealogical theory. This would be a new approach and a contribution to text genealogy, and, broader, to philology and the study of literature.

As we will see in §3.2.1 and §3.2.2, the use of the computer in stemmatology is not new. On the contrary, this machine has played first fiddle in stemmatology the last decennia. Until now, it has been used in the text-genealogical fields to perform *inductive and mathematical-statistical* works. In the scientific climate in

the humanities inductive science became almost a synonym for good science: objective and only working with uncoloured facts. Deductive science, as performed by Lachmannians and many other scientists in the humanities, was considered subjective and unverifiable. The computer's tasks in inductive stemmatology were to order large numbers of variants objectively, to filter out contradictory variants based on the *Law of great numbers*, and, of course, to draw chains and stemmas. The status of variants was less important. This contradicts the lesson we learned from biological cladistics. We need historical elements to build historical trees; only very few differences between species are historical in the sense that they reveal something about their historical relationships. When we take, for instance, the frequency of the characters of the alphabet in the *Lanseloet* texts, these *objective facts* can be expressed in a tree. However, it is very unlikely that this 'character frequency tree' will give a correct, abstract view of the historical, genealogical relationships of the *Lanseloet* texts. If we use as many variants as possible as the objective facts to build a *Lanseloet* tree, we may have analogous doubts, because not every textual difference provides historical information about the relationships of the *Lanseloet* text versions. In other words, I doubt the value of the inductive approach to use as many objective variants as possible.

But what about the criticism that deduction, like the Lachmannians used, is subjective? Well, there is nothing wrong with basing scientific research on possibly subjective thoughts or hypotheses. The subjectivity is not the problem, but the unverifiable aspects of sudden subjective feelings or judgements. Here is what we will do in this chapter: we will build a theory, consisting, eventually, out of about twenty-four characteristics with which we can discriminate *good* and *false* variants. These characteristics will be subjective thoughts, not objective facts. However, the computer will process the characteristics in an unsubjective way. With the computer output at hand (see Appendices C and D) we can precisely check how the characteristics have been applied. Then we will let the software package PAUP build a text-genealogical tree from the selected variants. PAUP enables us to test whether this tree is trustworthy. If so, we can evaluate the quality of the characteristics and gain valuable scientific knowledge.

The deductive process is visualized on the next page, in fig. 35. The current chapter concerns the first three items mentioned in it: the theoretical framework, its formalization and its implementation. From §3.2 on, the basic text-genealogical concepts are expressed in seven rules or hypotheses. During the formalization process, described in §3.3, eleven main characteristics (and thirteen subcharacteristics) of variants will be derived from the seven rules. This will result in a list of twenty-four items with which the text-genealogical virtues of variants can be determined. While the framework of basic rules has an abstract character, the characteristics are clear and falsifiable hypotheses. In other words, from a scientific point of view, the characteristics come closer to being a *theory*. However, the word 'theory' goes further and implies a complete system of thoughts. I do not think that the characteristics are such a complete system or a

complete method. Perhaps they will be in the future. The title of this chapter, ‘Towards a new text-genealogical method’, must be interpreted in that sense.

1. **THEORETICAL BASIC RULES**. Formulate a theoretical framework in words expressing my text-genealogical principles.

2. **FORMALIZATION**. Derive concrete (recognizable) characteristics of variants from these basic principles. These characteristics are clear, text-genealogical hypotheses, which can be verified and applied to, in our case, the *Lanseloet van Denemerken* text versions. One could say that the characteristics are my (expandable) text-genealogical THEORY. The text-genealogical cha-characteristics or hypotheses are split into three categories:
   2a. Undubious or certain characteristics or types of variants (for instance, as we will see: the variants we use must be substantive nouns or verbs; etc.).
   2b. Dubious or unclear characteristics or types of variants.
   2c. Certainly incorrect characteristics or types of variants, not to be used for building a text-genealogical tree.

3. **IMPLEMENTATION**. Develop computer software which teaches the computer to perform or test all the characteristics.

4. **APPLICATION**. Run the software; in other words, let the computer run the theory. The result will be a list of variants, accompanied by computer-generated comments as to which types/characteristics of variants they belong.
   4a. Let the computer make a selection of all certain types of variants (see: 2a) in the *Lanseloet* corpus.
   4b. Feed these certain variants into the software-package PAUP, and order PAUP to build the *Lanseloet* chain.

5. **EVALUATION**. Determine whether the characteristics (the theory) have been confirmed, need to be adapted, or must be rejected.
   5a. Remove bugs from the software and run it again (see 4.)
   5b. Let PAUP investigate whether the tree is trustworthy, by measuring its consistency. (Build a stemma from the chain, and compare it with stemmas produced by other scholars.)
   5c. The results of 5b may differ, but suppose that PAUP says that the tree is very trustworthy.
      5c1. Conclude that the utilized types of variants, c.q. the certain characteristics (2a) have not been falsified but confirmed. Adaptation or rejection of these characteristics is unnecessary.
      5c2. Check whether the supposed ‘false’ characteristics (2c) are in disagreement with the trustworthy tree. If they are, the doubts about these characteristics are confirmed. If they are not, we should reconsider the text-genealogical value of some of these supposed false characteristics.
      5c3. Check whether the unclear types of variants (2b) agree with the trustworthy tree and draw conclusions.

Figure 35. Schematic presentation of Salemans’s deductive approach.

During the implementation phase the text-genealogical characteristics are transformed into computer software; this software will be described in §3.4. Once the software is ready, the theory can be performed (and tested) rigorously by the computer. This process will be discussed in chapter 4. Although the first three phases (theory, formalization and implementation) seem to be strictly separated and successive, in practice they were mixed.

3.2. THE THEORETICAL FRAMEWORK: SIX BASIC TEXT-GENEALOGICAL PRINCIPLES

3.2.1. THE FIRST BASIC PRINCIPLE; THE DEFINITION OF A TEXT-GENEALOGICAL VARIANT; PARALLELISM AND CONTAMINATION

In chapter 2, we discussed some general taxonomical principles. Now, we have to answer the question which elements in text versions can throw light on their relationship. In other words, the question is which elements of text versions can be used as features to build chains and genealogies (stemmas)? We restrict ourselves here to purely textual elements, disregarding for instance bibliographical and codicological features (which will be briefly discussed in §4.2). From the examples in the previous sections, we have learned that we must be very careful when choosing textual or other elements to reveal genealogical information.

The first text-genealogical principle we will discuss is rather Lachmannian: when reading 'x' changes to a new reading 'y' this only has relationship-revealing power when it is impossible or highly unlikely that 'y' will change to 'x' again. Small changes, which can be corrected easily, should not be used for the development of text-genealogical trees. We are interested in big changes, like the omission of two rhyming verses, which cannot be corrected by copyists. Admittedly, we cannot be absolute certain that a very creative copyist could not (re)invent both missing verses; nevertheless, it is highly unlikely that a copyist would be able to do so.

Notice that in our description of the first principle we use, between the lines, the notion of the originality of a reading, since we speak of a change from 'x' to 'y'. As we have seen before, it is often difficult or impossible to determine the originality of a reading. Therefore, we will reformulate the basic text-genealogical principle as: when text versions show variant readings, these variant readings can only be used for text-genealogical purposes if it is highly unlikely that one of the variant readings could change easily to one of the other variant readings.

Thus, the variants must have a steady form. We stress that it is the text-genealogist's task to elaborate on the argumentation for this steadiness of the chosen variants. A genealogy does not have any value, if we do not know how and why the features by which it was built were chosen. In Salemans (1989:324f) and (1996:6), I formulated this as

the first text-genealogical basic rule:

> **A genealogical (or relationship-revealing) variant is a textual difference that fits well and inconspicuously in a text version.**
> (Appendix to this rule: Because a genealogical variant fits well in a text version, it is plausible that it keeps its form during the text transmission and will not be submitted to changes, except for small, trivial, differences in the spelling and punctuation.)

A taxonomic ordering, like a stemma or a chain, is a description of the way the ordering tools present themselves in the taxons, *in casu* the text versions. The order or structure is a reflection of the ordering tools. When the tools are inadequate, the order they produce is likely to be inadequate as well. This is why it is of utmost importance that text genealogists critically consider the criteria for choosing their ordering tools.

Text genealogists often use textual differences, *variants*, as tools to uncover the kinship of text versions. The inexhaustible computer can help to detect all the variants quickly. Yet, not all the variants are *genealogical*, in the sense that they possess relationship-revealing powers. An editor of a text-critical edition might be interested in all the variants, but text genealogists are mainly interested in variants that reveal something about the kinship of the text versions. One important restriction for all text-genealogical methods is that the variants used must be *(genealogically) significant or informative variants*. It would be wrong to think that every textual difference is automatically a variant which can be used for the building of a chain. When a variation place shows textual differences, the first thing we have to do is to judge whether the variants are significant, in the sense that they can offer us information about the relationship of the text versions.

If a variant X can easily turn into another variant Y, and variant Y can easily turn into variant X, the occurrences of these variants in text versions do not provide trustworthy information about the relationship of these texts. Therefore, we define a *text-genealogical moment* as the historical event in which a variant X changed or transformed into a variant Y in such way that it is unlikely that variant Y would retransform into variant X.[40]

Only when it is implausible that a variant changes into other variants, we can use it as an indicator of a relationship between text versions. In other words, only elements that fit well in the text have reasonable chances to 'survive' and obtain a stable place in a text version. Only that kind of variants can serve for text-genealogical purposes. For instance, a copyist can or will rectify obviously incorrect words in the text he copies, the so-called *exemplar* (see Willis 1972:228) or *layer*. Logically, grammatically incorrect text elements and clearly misspelled words cannot be used to build text-genealogical trees. Of course we need solid linguistic knowledge to detect ungrammaticalities and misspellings.

[40] An illogical variant, for instance, may attract the attention of a copyist. He might try to improve this eye-catching variant. If an earlier variant can easily be reconstructed from the illogical variant, this variant is genealogically insignificant.

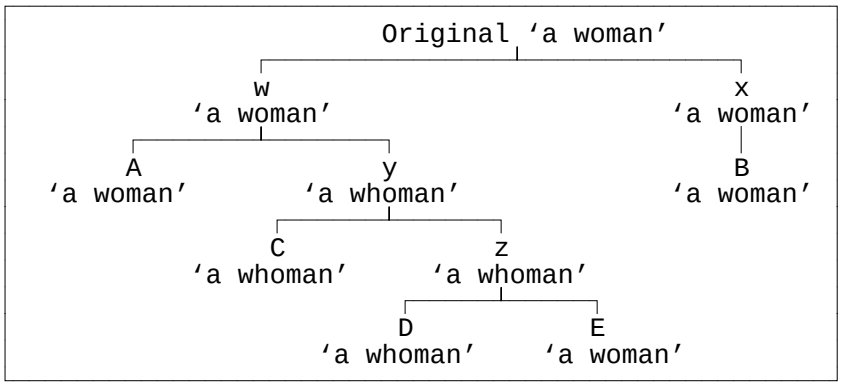

Figure 36. Evident mistakes may be text-genealogically misleading.

We use fig. 36 to demonstrate that it is important to work with grammatical and well-spelled variants only. Suppose we have five text versions A, B, C, D, and E. A-B-E- show at a certain variation place ‘a woman’, where C-D- show ‘a whoman’ in which the character ‘h’ has been added, which is obviously incorrect. Ignoring the fact that obvious mistakes may provide false genealogical information, one could incorrectly conclude that C-D- belong to one unique text family and A-B-E- to another. This is demonstrated in fig. 36, in which w, x, y and z represent lost manuscripts. Roughly speaking, the copyist of text y introduced the reading ‘a whoman’. The copyists of texts C, z, and D copied this reading into their texts; they did not correct it. The copyist of text E recognized the error and reproduced the original reading ‘a woman’.

We conclude that evidently incorrect elements attract attention and ask to be corrected, changed or eliminated. Small differences in spelling between variants, as expressed in the first rule (see the Appendix), are equally unimportant.[41] Genealogical variants must be nearly irreversible textual elements that fit well in the texts (and do not draw the attention of the copyists).

The word ‘plausible’ in the rule implies that every textual difference has to be *evaluated* before it can reach the status of a genealogical variant. Some scientists

[41] The element “except for small, trivial, differences in the spelling and punctuation” in the first rule (see the Appendix) is based on the fact that in the Middle Ages there did not exist any explicit, generally accepted, orthographical conventions for the ‘vulgar’ (i.e., non-Latin) languages. Therefore, the same word form (e.g. ‘Karel’) can be presented by different copyists in different spelling forms (e.g. ‘Kaerel’, ‘Kairel’). These spelling differences are genealogically unimportant, because every copyist will recognize what is meant by a word in different spelling forms and will usually adapt the spelling of that word into a form which he prefers (e.g. ‘Kairel’). Nevertheless, we must be careful in using a vague category like ‘small differences in spelling’. Tools are needed for determining whether variants consist of genealogically unimportant differences in spelling. For the Dutch medieval dialects the MNW (1885-1952) and MNHwb (1932, including the 1983 Supplement) may act as tools; for younger texts the WNT (1882-...) is suitable. Of course these dictionaries do not cover all Dutch words, but as a tool to detect nonsense words they may be reasonably accurate.

shudder at the idea of data needing to be evaluated. They believe that judgements or interpretations are condemnable by definition. Their paradigm seems to be 'subjectivity is a sign of bad science'. We will discuss this disapprobation more specifically in §3.2.2; however, a few comments can be made here. First, a scientist's subjective judgements are perfectly allowable, when the scientist justifies them and shows precisely when, and, preferably, on what grounds, he makes them. If he does so, his subjectivity becomes *inter*subjectivity. Second, objective, undeniable *text-genealogical facts* for building text-genealogical trees simply do not exist. As explained above, not all the textual differences between text versions offer text-genealogical information. A careful analysis of the variants is necessary. Third, judgements are not necessarily arbitrary. They are often formulated in concrete rules or characteristics, as we try to do. Moreover, it would be a misunderstanding to think that a theory has become completely objective once it has been formulated in computer terms. Subjective and ad hoc elements can be introduced and programmed into computer systems and software as well.

A good example of a variant type, which clearly does not reveal kinship, is the *parallelism*, also known as *coincident variation* or *accidental (variation)*. Parallelism is the phenomenon that the same variants show up in text versions spontaneously or by accident, while these text versions do not have a common ancestral text.[42] Logically, parallelisms do not offer reliable information about the relationship of text versions. This is also true for a special type of parallelism: *contamination* (see fig. 38), also known as *conflation*, *text bastardy* and *change in relationships* (see van Mulken 1993:111).[43]

Textual parallelism is also described in Salemans (1989).[44] Fig. 37 offers us

---

[42] See Salemans (1987:202). I borrowed the notion *parallelism* from the biological sciences. This term is more adequate than the rather vague term *accidental*. Additionally, in text-genealogical literature the term *accidental* is usually used for 'small, inferior differences in spelling' or 'small differences in which the sense is not affected' (Dearing 1974:34). As we will see, these 'small differences' are just a part of the possible types of parallelism. Havet (1911:§543: 'Parallélisme') uses the notion 'parallelism' as well, but I am not influenced by Havet's work.

[43] A contaminated text contains characteristics or variants that have been derived from several ancestral texts. Most current text-genealogical methods assume, as I do, that variants point to a single line of relationship. In fig. 38 the contaminated text version Y shows the variant 'skin', which points to a relationship to the U-family. The variant 'yellow' denotes other, contradicting family ties, i.e., to the V-family. At the moment, no convincing solution for contamination is known.

[44] Salemans (1989:336-341) describes textual differences, 'parallelisms' or 'accidentals', which can be changed or recognized by copyists. These uninformative variants are, in English translation:

a. Differences in use of capitals and small letters ('Karel de Grote' vs. 'karel de grote').
b. Differences in spelling ('roesen' vs. 'roisen').
c. Differences in dialect and language ('brood' vs. 'bread').
d. Differences in use of punctuation marks ('oh! oh!' vs. 'oh, oh').
e. Differences in boundaries of words ('metten' vs. 'met den').
f. Differences in clause headers (or incorrect placement of or clear absence of clause headers), if

artificial examples of parallelisms. Suppose an author has described, in a lost original text O, the white skin of his beloved. Six copyists transcribe it according to the pattern of the stemma in fig. 37.

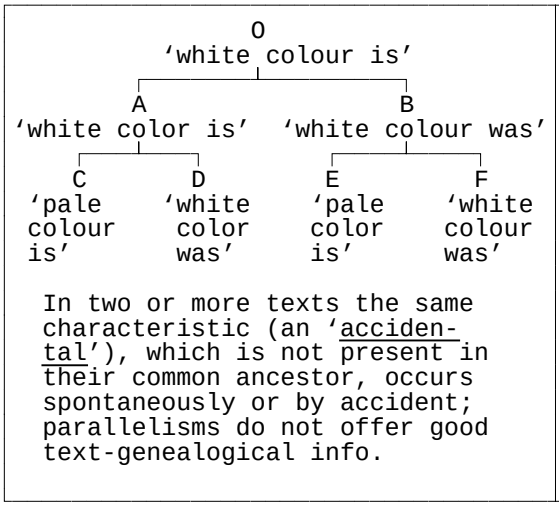

Figure 37. Parallelism.

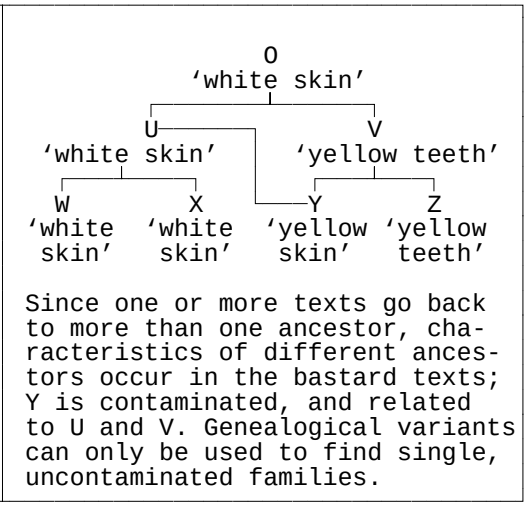

O
'white skin'
U
'white skin'
V
'yellow teeth'
W
'white skin'
X
'white skin'
Y
'yellow skin'
Z
'yellow teeth'
Since one or more texts go back to more than one ancestor, characteristics of different ancestors occur in the bastard texts; Y is contaminated, and related to U and V. Genealogical variants can only be used to find single, uncontaminated families.

Figure 38. Contamination.

Several types of textual parallelism exist (see fig. 37):

a. *Synonymous parallelism* ('white' ←→ 'pale'). Text versions C and E show the adjective 'pale', while the other texts have 'white'. We must ask ourselves repeatedly whether it is possible that copyists spontaneously introduced more or less synonymous variants in text versions. We can easily imagine that a

---

the same clause of a play is spoken by different people (in some *Lanseloet* texts clauses occur with incorrect clause headers; a copyist familiar with the text could detect these false headers and simply correct them).

g. 'Ungrammaticalities' (ungrammatical sentences can often be easily corrected).

h. 'Nonsense Readings' (compare Duplacy 1979:28; Epp 1976:168).

i. Copy mistakes ('Karel de Grote' vs. 'Krl de Grote'; compare Epp 1976:168).

j. Names (...). In the *Lanseloet* text versions reference is made to 'sint Jan' and 'sint iohan'. This is a clear example of a ungenealogical variant (...): the names of 'Sint Jan' and 'Sint Johannes' are still used for indicating the same saint. Different names in text versions, which refer to the same person, are only genealogically relevant (...) if the names concern unknown persons, who normally do not play an important role in the story or 'the world'. (...) (See also note 82.)

k. Archaic words. Many copyists will use a more contemporary word when confronted with an archaic word. Therefore, there is considerable chance that copyists working with minimally related exemplars introduce the same more modern word in their copies. The occurrence of the same more contemporary word in the text versions is not due to equal descent, but by diachronic change of language: they are not genealogical variants but parallelisms.

l. Frequently used words, which are usually not kinship-revealing (or text-genealogical) and, therefore, must be treated with the highest caution.'

See also Dearing (1974:21-58).

'white' could be altered into 'pale'. Like all parallelisms, synonymous parallelisms do not offer information for building genealogical trees. If we neglected this, we would conclude incorrectly that texts C-E- go back to one common text (having 'pale'.) Synonymous parallelism concerns not only adjectives, but also nouns, conjunctions, pronouns, etc. Words in these categories can often be interchanged without damaging the meaning of a sentence.[45]

b. *Regional parallelism* ('color' ←→ 'colour'). 'Color' and 'colour' are not used in this example as trivial spelling differences,[46] but as regional (American and British English) variants. Every region has its own specific words and linguistic peculiarities. Copyists from the same region can introduce, independently of one another, the same words in their text copies. Sometimes, they borrow words from other dialects.[47] It is likely that an American copyist will write 'color' and an English copyist 'colour', no matter what reading the exemplar contains. The American texts A-D-E- show 'color', not because they go back to the same ancestral text version, but because their copyists come from the same region.

A related type of parallelism is the *idiolectic parallelism*. Copyists have their own personal preferences in language use. For instance, a copyist can prefer certain word orders, while other word orders are equally possible.[48]

---

[45] Compare the sentences: '*one* can say ...', '*you* can say ...' and '*we* can say ...'. These sentences differ in the subject pronoun, but may have an identical meaning. In the Dutch language many words have been derived from other words by the use of affixes, like suffixes '-tje', '-schap' and prefixes 'be-', '-ge', '-her', '-ont' (ANS 1984, §2.6 and §8.5). Often the words with the added suffixes have a meaning closely related to that of the words from which they originate. This implies that the words can be interchanged rather easily. Logically, when Dutch text versions show suffix variants, we should be aware of the danger of synonymous parallelism. See also the previous footnote, points j and k.

[46] If 'colour' and 'colour' were to be considered as trivial spelling differences, the problem of parallelism would not exist. The first rule states that such differences are ungenealogical, irrelevant.

[47] Van der Wal (1992:121-122) remarks that texts often show characteristics of several dialects. Often copyists introduced, intentionally or unintentionally, characteristics of their dialects into texts. Furthermore, van der Wal (1992:121-122) quotes the famous Flemish medieval author Jacob van Maerlant to demonstrate that it was common practise that authors, in search of rhyming words, borrowed words from other dialects. Van Maerlant remarks in his hagiography, *St. Franciscus*, that for the sake of rhyme an author can take refuge in *misselike tonghe* 'different languages or dialects'. See also the remarks of van Mulken (1993:124-152) on the analysis of rhyming words.

[48] Consider the place of the auxiliary verb in modern Dutch subordinate clauses, which is dependent on the taste of the native user. It can be put at the end or near the end of the clause. The Dutch translation of the sentence 'he says that he has been punished' can be dependent on the taste of the native user. It can be put at the end or near the end of the clause. The Dutch translation of the sentence 'he says that he has been punished' can be 'hij zegt dat hij is gestraft' as well as 'hij zegt dat hij gestraft is'. Therefore, the place of the auxiliary in a subordinate clause in Dutch text versions is text-genealogically speaking not informative. A study on the word order in a verbal end cluster in modern Dutch is offered by Haeseryn 1990. He demonstrates that it is parallelistic

Agreements in personal preferences are purely coincidental and do not give us information about the relationships of texts.

c. *Inflectional parallelism* (‘is’ ←→ ‘was’). We know that the tenses of verbs, with or without an aspect auxiliary,[49] can change rather easily, often without changing the meaning of a statement (for example, the *praesens historicum*). Therefore, for the moment, we assume that tenses of verbs are, in general, parallelistic (‘is’ = ‘was’; ‘heb’ (English: ‘have’) = ‘had’ (English: ‘had’) = ‘heeft gehad’ (English: ‘has had’); etc.). Analogously, substantives and other nouns occur in various numbers and cases. It seems that also these forms and cases do not offer trustworthy information on the kinship of text versions.[50] To avoid the dangers of parallelism, we choose to work with the basic, uninflected forms of substantives and verbs as genealogical informants. Once we have prepared the text-genealogical tree with nearly undisputable variants, we can check whether the hypothesis that tenses and inflections are parallelistic makes sense in practice or should be adapted. Possibly, we will discover that the tenses of verbs are not parallelistic.[51]

d. *Diachronic or historical parallelism* (not displayed in fig. 37). This type of parallelism is caused by the development of languages throughout the ages. The lexicons of languages are dynamic. Some words become obsolete and are replaced by new words. Independent from each other, copyists can replace the same old-fashioned words with the same new words.

   The absence of small, (highly) frequently used words in text versions is likely to be parallelistic, too.[52]

(Haeseryn 1990:398:) ‘As far a the sociolinguistic aspects are concerned, important regional differences emerge, particularly between the Netherlands and Belgium’.

[49] In Dutch the auxiliaries of the perfect, the present and past perfect tenses, are ‘hebben’ and ‘zijn’. The auxiliary of the future tense is ‘zullen’. Van der Wal (1992:151) states that throughout the Middle Ages the frequency of the use of the perfect tense grew considerably. Logically, we could say that the use of the perfect tense in text versions is a diachronical parallelism rather than an inflectional parallelism.

[50] Compare: ‘Houses without *a roof* are unusual’ and ‘Houses without *roofs* are unusual’.

[51] In §3.2.6, just before the formulation of the final version of the fifth hypothesis on word order, I will discuss the strategy that can be followed when there is any doubt on the text-genealogical relevance of a textual variant.

[52] Dain (1949/1975:48): ‘Certaines fautes sont plus communes que d’autres. Il en est au moins deux que tous les copistes, sans exception, commettent couramment. C’est d’abord l’*omission des petits mots*. Les termes courts, et surtout ces petits mots qui constituent les «utilités» de la phrase - liaisons, conjonctions, particules, prépositions - ont une tendance étonnante à disparaître sous la plume des copistes, au moins quand il s’agit des langues anciennes. Le verbe «être» et, chose à peine croyable, les négations n’échappent pas à cette règle. (...) Un second type constant d’erreurs de copie, depuis longtemps étudié, est *le saut du même au même*. C’est de beaucoup la faute la plus commune.’

Many text genealogists assume incorrectly that all the textual differences between text versions, sometimes with the exception of small differences in spelling, can be used to draw text-genealogical trees. From the four types of parallelism presented we can see that many non-spelling variants can offer false information about the kinship of text versions. It could be argued that parallelisms do not frequently occur in text versions and, therefore, could be filtered out by statistical or mathematical analysis, like cluster analysis. For text genealogy this is a dubious approach. A single, trustworthy variant can provide better information about the shape of a text-genealogical tree than a thousand other untrustworthy variants. We fear that statistics, a.o. working with the Law of Great Numbers, filter out that one (good) variant when it is, e.g., in contradiction with two or more other (incorrect) variants.

Finally, it should be noted that it is possible that a variant with a parallelistic character can offer information that is in agreement with the true historical, genealogical relationship of text versions. If a variant has a parallelistic character this does not necessarily imply that it is always in conflict with the genealogical tree. The point is that *potentially parallelistic* variants *can* offer false information, which renders them unreliable for the construction of text genealogies. The danger is that parallelistic variants *can* lead to incorrect trees. Therefore, we advice against working with them.

3.2.2. The Second Basic Principle; the Apparatus of Text-Genealogical Variants; a Short Discussion about 'Objectivity' and Quentin's 'Non-Positivistic' *Zéro Caractéristique*

The second text-genealogical basic rule:

> **(Genealogical) variants used for the construction of a chain or stemma have to be presented in an apparatus of variants or in a synoptic edition, so that the stemma and the variants can be checked and, if needed, falsified.**

Nowadays, many stemmatologists consider most variants to be genealogically significant, apart from orthographical or spelling differences. This is incorrect, because many variants may be parallelistic. Subsequently, they let a computer treat a bulk of variants, which results in a chain or a stemma. The point is that text genealogies must be based on good, well-formulated principles, from which we can learn and which can be attacked or falsified. The second text-genealogical basic rule says that we have a right to know from which observable, i.e. *positivistic* elements an author has used to develop his text-genealogical tree. Those, who, like traditional 'Lachmannians', draw stemmas without the use of the computer, must be able to check how the trees are produced.

Genealogical software produces an enormous apparatus of variants that cannot be completely printed in publications. At least a part of the apparatus should be printed in order to give the readers an impression of how the stemma or chain has

been built. Another possibility is to put the complete apparatus on a server computer of, for instance, a university library, connected to world-wide computer networks like the Internet. With file transfer ('ftp') or the World Wide Web ('www' or 'web') users can read the distant apparatus on their own computers.

The second rule is not a strictly text-genealogical rule. We consider it to be an important and generally accepted scientific principle. Nevertheless, it is often violated by 'computerized' text genealogists, like, for instance, Dees.[53] Trees are too often presented without disclosing the fundamental apparatus of genealogical variants; variation formulas are presented as though these formulas were obvious objective facts. In the formulas, the text versions are clustered in groups that show the same variants. Because these text genealogists do not offer the variants with which the formulas are composed, it is impossible to check their adequacy.

The second rule deals with the scientific principle that a researcher's material must be presented to others. I would like to discuss now a related scientific principle as well: the principle that scientists must work in an objective way.

The disregard of (not-presented) variants is caused by the fact that in 'modern' text genealogy the influence of non-philological, statistical or mathematical methods has grown drastically, almost beyond philological control. Before the sixties, text genealogy generally belonged to the philological, deductive branch of science. Philologists were focused on the question which variants in text versions could provide text-genealogical information. As we saw in §2.3, a central issue in the method of Lachmann (see Maas 1957) was the verification of a variant as a *common error* or *common change*. With the knowledge of some of these so-called *common changes* a stemma could be built. The problem was and is that it is difficult to determine whether a variant is a common change. In the past few decades, the importance and influence of the mathematically oriented natural sciences has grown enormously. In the humanities, more and more scientists have fallen back on the *empirical paradigm*.[54] In this paradigm, the importance of gathering and ordering little facts is emphasized. Often deductive theories, hypotheses and judgements were regarded as inferior, dangerous and unscientific. Probably due to the strong general admiration - or is it perhaps an inferiority complex? - of the humanities for the methodology and requirements of the natural sciences (e.g., prediction and testing), many members of the humanities chose for the empirical, inductive mathematical methods of the natural sciences to legitimize the scientific character of their own branch of science.[55] Textual

---

[53] The Method of Dees has been attacked by Duinhoven (1988-89) and by Salemans (1996:22-24;57-58).

[54] The philosopher Thomas S. Kuhn formulated the philosophy of the paradigm. For a long period of time, researchers within a scientific discipline build, intentionally or unintentionally, their works on one central slumbering but undisputed framework of thinking, a paradigm. See Kuhn (1970), van Buuren (1988:34-40), and Salemans & de Bonth (1990-91:210).

[55] We get the impression that many philologists and other scholars within the humanities think that

criticism, with its hypotheses and subjective (Lachmannian) judgements, was generally judged by these 'modern' text genealogists to be unscientific. Deductive textual criticism, including the method of Lachmann, had to be reformed in accordance with this new empirical, inductive view of science.

The first results were promising. The discovery that stemmas can be built in two steps is an idea that is accepted by most modern text-genealogists. The first step is to build a chain with the aid of genealogical variants, without judging their (un)originality. The second step is the transformation of the chain into a stemma, using knowledge about the originality of a few variants. This implied that the philological judgement about variants as text-genealogical informants became less important. Modern text genealogy started to focus on developing methods to create textual trees with *unjudged* variants. Generally, all the observable textual differences, except maybe for small spelling differences, were considered to be sound text-genealogical variants. The all-mighty mathematical principles could build text trees from nearly any set of variants.

In my view, it is time that philologists regained fundamental influence in text genealogy. Duinhoven (1988-89), for instance, has shown that 'modern' text genealogy has produced impossible stemmas, due to the incorrect use of variants. In §2.6.3, we saw that Dearing's mathematical 'trick' for building simple variation formulas from complex formulas can lead to incorrect results. Furthermore, it would be a misunderstanding to think that statistics offer absolute objective tools with which to perform absolute objective science.

What is an *objective fact* as used by statistics? The first requirement is that the fact must be valid or relevant;[56] it must be related to the goal of a research. If we want, for instance, to test someone's intelligence, the objective facts that this person possesses a bicycle and that he lives in a house with a flat roof are irrelevant for the investigation.

The choice of the facts determines the end result. Notice that in this choice unverifiable subjectivism may be hidden. Therefore, it must be justified. My claim

---

mathematicians are deductive scientists, who derive in an undisputable way new formulas or properties of numbers from basic axioms. According to this view, mathematicians do not 'feel' or 'guess' or work with 'vague ideas', like philologists do. On the contrary, they are able to *prove* in an objective way, with watertight reasonings, their scientific findings. This view of the purely deductive mathematician needs to be changed. Many mathematicians do not have the slightest difficulty with testing (subjective) hypotheses. An example of such inductive mathematical research is the search for large prime numbers. Mathematicians, like Dr. H. te Riele from the CWI (Centrum voor Wiskunde en Informatica) Institute in Amsterdam, study prime numbers in an experimental way, with (subjective) intuition or brainwaves, testable hypotheses, etc., to get a better picture of the abstract world of numbers.

[56] See Butler (1985:viii): '(...) we face the problem of designing our study in such a way that it will isolate just those phenomena we wish to test. The samples we use must be chosen so as to minimise variation arising from unwanted complicating factors, so that we can be reasonably confident that any effects owing to our chosen phenomenon are not swamped by other, 'irrelevant' effects. (...) No amount of sophisticated statistics can compensate for a badly designed investigation.'

is that most textual differences, although they may be objective facts, are irrelevant for the development of a genealogical tree. Often statistical text-genealogists accept, without any justification, all the textual differences as objective facts for building genealogies. These facts are objective indeed, but are they relevant? Butler's warning (1985), as mentioned in footnote 56, is repeated here: no amount of sophisticated statistics can compensate for a badly designed investigation.

Furthermore, the objectivity of statistical tools must not be overestimated. Brefeld (1994)[57] clearly demonstrated the limitations of the objectivity of some statistic tools. For example, after a statistical cluster analysis of certain pilgrim's guides, Brefeld detected in an objective (and admirable) way that certain clusters of guides show close relations. A statistical factor analysis showed her that there are a few factors that bind the clusters. However, the analysis did not describe the characteristics of these factors. It was up to scholar Brefeld to do so; statistics could not help her in this matter. The formulation or description of the factors was a process of interpretation, in which subjectivity may be hidden as well. In other words, although statistical tools may be objective, this does not guarantee that they provide absolute objective end results of a research.

Of course, we do not claim that all modern empirical or statistical text-genealogical methods are useless or that deduction is scientifically better than induction. However, historical or relational trees require historical or relational building blocks. This is one of the fundamental ideas behind the text-genealogical concepts and rules expressed in this paper. A related idea behind this book is that the mathematized text genealogy should be given back to the philologists. After philologists have developed clear ideas or methods to detect informative variants, they can ask their 'empirical' colleagues to produce trees from the selected variants, if necessary. Mathematical 'tricks' may be very helpful, but they should never be the main theme of text-genealogical studies.

In the current section we expressed that we prefer to work with *positivistic*, observable textual differences as text-genealogical tools.

Quentin (see Quentin 1926) and his 'successor' Zarri (see Zarri 1977) developed a method to draw chains by using so-called *intermediate text versions*. A text version Y is an intermediate of the text versions X and Z, when X and Z together show no differences with Y, i.e., Y contains no variants which are not present in X as well as in Z. This is also called the *zéro caractéristique* of the

[57] Brefeld (1994) is reviewed by Salemans (1995). Although I do not agree with all details of Brefeld's statistical approach to build genealogies, I want to stress that her book clearly demonstrates the benefits of, for instance, cluster analysis for text-genealogical research. Furthermore, Brefeld explains precisely how and why she works with certain statistical tools. Her clear explanations are (almost?) unprecedented in statistical text genealogy. Brefeld (1994) is also reviewed by Duinhoven (1995). Duinhoven does not see any virtues of the statistical approach to build genealogies.

intermediate. Suppose that X shows the variants {a,b,c,d,e} and Z {x,y,a,b,c}. When Y is the intermediate between X and Z, it must contain all the variants which occur in both X and Z, namely {a,b,c}. Logically, when Y contains, e.g., the variants {x,a,b,c,d}, it can be the intermediate between X and Z. When tracing the intermediate text versions, the chain becomes clear.

In my view the basis of the construction of the chain by intermediates is too passive or non-positivistic. The detection of a non-positivistic or non-observable *zéro caractéristique*, namely the absence of indications that a text version is not an intermediate text version, is used as a positive sign or tool for determinating genealogical relations. When a text genealogist does not find such differences, it may be that his or her text comparison is inadequate. Dekker (1987:64; translation BS), an intermediatist with his own interpretation of intermediacy, warns:

> When determining intermediacy, we will always have to keep in mind that the absence of indications (*c.q.* enough indications) that a manuscript is not intermediate does not guarantee that the manuscript actually is intermediate.

The distance between two nodes in a tree is expressed by the number of differences in values of these nodes. When, for instance, two nodes X and Y have in forty variation places the same value, but in two places different values, the distance between both nodes is ‘2’. If the distance is ‘0’, both nodes are the same, as we saw when we discussed fig. 5. PAUP computes for us all the distances between all the nodes, among which the intermediates (non-end nodes).

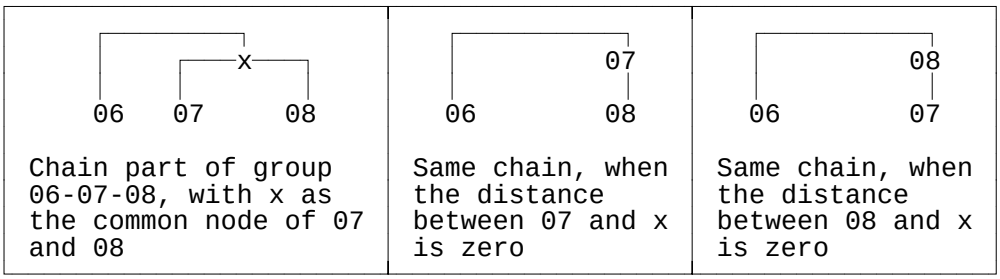

Figure 39. The collapsing or removing of branches with a zero length.

Suppose that the distance in a tree between a certain node x and a text 07 is zero. Then, x and 07 may be considered to be the same nodes, which implies that 07 can take the place of node x, as pictured in the middle part of fig. 39. This phenomenon of removing a branch with a zero length is called the *collapsing or contraction of a tree branch*; in this case the branch between x and 07 disappears. When the distance between x and 08 is zero, we can scratch the branch tree between x and 08, as displayed in the right part of figure 39.

Chains in which all the delivered text versions are displayed as end nodes at the end of a branch are totally satisfactory, because they offer a good view of the relations of the text versions, apart from some minor details. Such a detail is the possibility to *collapse* (or *contract*) zero length branches of a tree. It is a fascinating detail, because in this way we can visualize that one text is the forefather of another text (or better: the far forefather of another text, since on every branch of a tree lost, non-delivered, texts can be imagined). There is one distinct advantage of the contraction of branches or the determination of intermediate texts. If we can show that a certain dated text X is the forefather of an undated text Y, we know that Y cannot be older than X, which means that we can give a date *post quem* to text Y. As we will see in §5.2.4, Hüsken & Schaars (1984) use this idea to determine when the *Lanseloet* text version from 's-Gravenpolder, S/BO(=14), was written.

There lies a danger in collapsing zero length branches (see fig. 39). If the distance between two nodes in a chain is zero, this is because both nodes have precisely the same genealogical variants with which the chain was developed. It is still possible that on a zero length branch lost texts may be imagined. The collapsing of zero length branches seems to be more or less equivalent to Quentin's *zéro caractéristique*, because in both cases texts can become intermediate nodes. Therefore, the warning against working with these caractéristiques is also true for the contraction of branches. The fact that we do not find differences between two texts or nodes does not necessarily imply that one text or node is an intermediate. If we want to be on the save side, we should simply avoid collapsing zero length branches. Another possibility to avoid collapsing of branches is to find convincing type-1 variation formulas (as we will see in §4.7.3), which show that certain text versions are end nodes and not intermediate nodes.

There is a striking difference between Quentin's *zéro caractéristique* and our collapsing of tree branches with a length of zero. Quentin uses his *zéro caractéristique* as the fundamental element with which to build chains. We look at zero length branches between texts only after we have built a chain with clear variants. Then, when we are confronted with zero length chain branches between two texts with precisely the same genealogical variants, we try to find new (type-1) variation formulas concerning these texts. Once we have found such formula, we know that both texts no longer have exactly the same variants. Logically, the distance between both texts is not zero anymore. Then, the zero length branch changes into a branch with a length, say '1', and becomes incollapsable.

We can only consider collapsing if we are unable to detect such discriminating formulas. Suppose that we did not find such formulas and that two texts still have the same variants and are at a distance of '0' from one another. When we know, for instance, that both texts were printed by the same or a closely related printer (a member of the printer's family or by a printer who took over the busi-

ness), it is quite likely that the older text was an (immediate) forefather of the younger text. With such *(text-)historical information* at hand, it is not very dangerous to collapse a branch in such way that the older text becomes the intermediate ancestor of the younger text in the stemma. However, if this convincing (non-textual) historical information is not present, our default attitude will be to avoid the collapsing of zero length branches. Furthermore, we stress that, as a principle, we can always imagine undelivered text versions on branches, even if they have a zero length.

3.2.3. THE THIRD BASIC PRINCIPLE; THE DEFINITION OF A VARIATION PLACE

The third text-genealogical basic rule:

> **A variation place is that part of a text in which the still existing text versions show one or more different ('competing') variants, which are formed by at least one word (or smallest unit of meaning), while the surrounding words of the variation place in all the texts agree.**
> The variation place must be kept as small as possible to avoid the danger that it contains variants introduced during independent stages of textual transmission.

Roughly speaking, this rule suggests that it is preferable to use single words[58] in order to be cautious when choosing variants and variation places. Since a syntactic unit can consist of more than one word, it can contain different genealogical variants, introduced at independent stages of textual transmission. Therefore, we choose, as a principle, single words as variation places, rather than syntactic units. In other words, this rule may be summarized as the single word boundary of variants. However, in §3.2.5 we will see that such a summary is too rough and inaccurate.

---

[58] I will not define here the complex concept *word* in depth. I consider it to be the smallest, independent unit of meaning in a language. For modern Dutch, the spelling of words is regulated by law. Apart from a few problems, modern native speakers recognize the same words in a sentence. Until about 1600, spelling prescriptions in *orthographies* did not exist, nor did a universal Dutch language. We see that one copyist writes one word (e.g. 'opstont', 'euerzwyn'), where the other writes two words (e.g. 'op stont', 'euer zwyn'). It is, thus, difficult to define the notion (written) 'word' in old Dutch texts. However, both 'opstont' and 'op stont' express the same unit of meaning. I consider such differences in word boundaries to be potential parallelisms.

3.2.4. THE FOURTH BASIC PRINCIPLE: THE TYPE-2 LIMITATION

The fourth text-genealogical basic rule (or the *type-2 limitation*):

> **If all the text versions show at a variation place together exactly two genealogically significant variants, which each occur in at least two text versions, these variants can be used directly for the determination of the deep-structure of the stemma (the 'chain'). This kind of variation is called a *type-2 variation*.**

As explained in §2.4.2, a type-2 variation occurs when a variation place shows exactly two competing genealogical variants occurring in two true groups of text versions. The type-2 approach requires the presence of at least four text versions. In §2.5.2, we saw why true groups in type-2 variations offer direct information about the chain. We claim that complex variations, with three or more competing variants, cannot be used immediately for chain development[59] (see also the 'star chain' in fig. 32 of §2.6.1.2).

Notice that the fourth rule does not forbid the use type-1 variations. However, as explained in §2.4.3, their importance is limited. They are helpful in determining whether or not a text can be an intermediate node in a chain or an ancestral node in a stemma. Type-2 variations offer the more important general information about the shape of a chain. The fourth rule is in accordance with Greg (1927).[60]

---

[59] Salemans (1987:211-220, to be found in translation in Appendix E, §3.3 to §3.3.3) and Salemans (1990:438-442) explain that chains of taxons can be built when the *transformation order* of the character states is known. The determination of this transformation order can be troublesome, unless strictly binary character states or groups of variants are used. In that case, the transformation order is uncomplicated and clear. In textual variations binary groups of variations occur in *simple variations* or *type-1 and type-2 variations*. Since type-1 variations are genealogically unimportant, it is the best to use type-2 variations to build chains. This is the motive behind the fourth genealogical rule. The process of producing a stemma from a chain is delicate. Dearing (1974:44-56) mentions that the following variations are *directional*, offering information on how to orient (or direct) a chain: confusion of similar letters, misinterpretation of contractions, mistaken combination or separation of words, transposition (*anagrammatism* or *metathesis*), retention of once meaningful signs in contexts where they have no place, imperfect corrections, failure to repeat, omissions resulting from similarities in words or syllables, simple omission, omissions of standard lengths, insertions from the margin, miscellaneous bibliographical evidence and other possibilities.

[60] See Greg (1927:20-23): "It follows, therefore, that only those variants which give rise to at least two groups of more than one manuscript each can be described as (genetically) *significant variants*. And only those which give rise to groups all of which are of more than one manuscript can be described as *completely significant*. By *significant groups* we shall understand true groups (i.e., of two or more manuscripts) arising from significant variants. ... [A] type-1 variant can never be significant ... . Provided they are numerous enough, type-2 variants afford us all the evidence of which we can in the calculus make use. ... [It] will be apparent that it is only such variation as we see in type 2 that is fundamentally significant."

The strict use of only type-2 variations (and some type-1 variations) for building chains is a severe limitation, because many observed variations will not have a type-2 character. Unfortunately, in §2.6.2 we saw that Dearing's claim that new type-2 variation formulas can sometimes be deduced from complex variation formulas, is incorrect. 'Unfortunately', because I would prefer to use as many variation formulas as possible to develop chains and stemmas.

Perhaps, the type-2 limitation may be broken by a method, such as the one proposed by van Mulken (1993:58-62). She describes a interesting, drastic method for the decomposition of complex variation formulas into smaller type-2 formulas concerning four text versions. These formulas are called *quadruples*. Van Mulken (1987:60) gives an example: '*aclmqrt/bp* can also be expressed in the following list of variants: *ac/bp al/bp am/bp aq/bp ar/bp at/bp cl/bp cm/bp cq/bp cr/bp ct/bp lm/bp lq/bp lr/bp lt/bp mq/bp mr/bp mt/bp qr/bp qt/bp rt/bp*'. Analogously, a complex variation formula like *ab/cd/ef* can be rewritten in three quadruples: *ab/cd cd/ef ab/ef*. The idea is, in a nutshell, to build a list of possible quadruples and then to count the occurrence of each quadruple in all the (simple and complex) variation formulas. She uses the most frequently occurring quadruples to build the chain of the text versions.

This decomposition proposal is interesting. The quadruple approach deserves, at least, further analysis and study. If it is correct, the strict type-2 limitation is (almost) broken.[61] Nevertheless, for the moment, I still prefer to work with type-2 variation formulas.

Let me try to explain my hesitation to work with quadruples. Suppose that we decompose the formula AB:CD:EF into three quadruples AB/CD, CD/EF and AB/EF. This approach of acting for a while as if certain texts were not delivered to us, is attractive. We can imagine that, for instance, texts A and B were not delivered to us, which automatically turns the formula AB:CD:EF into CD:EF, which is a perfect type-2 variation formula. I do not see any problem with considering the quadruples AB/CD, CD/EF and AB/EF, derived from the formula AB:CD:EF, as (temporary) type-2 variations, with two groups, each with two texts. Since we know that groups in type-2 variations are end groups in the chain, we can use the quadruple groups to draw parts of the chain.

The problem is how to connect the groups detected by the quadruple approach to a chain. In §2.6.1.2, we discussed the danger of building chains from complex, non-type-2 variation formulas like AB:CD:EF. We saw that it is not necessary

---

[61] Possibly, biological cladistics, in particular the Fitch parsimony for unordered multi-state variations, can help us to weaken further the type-2 limitation. The PAUP software package offers facilities to build chains from non-type-2 variations. Wagner parsimony, with which I work, has an alternative called *Fitch parsimony*, which can treat unordered multi-state characters, which are non-type-2-characters (see the quote in §2.5.4). I have not studied Fitch parsimony thoroughly enough to oversee its undoubtedly interesting possibilities. In PAUP, Wagner and Fitch parsimony are implemented, as well as, Dollo parsimony and Camin-Sokal parsimony. More information on these parsimony methods can be found in the worthwhile PAUP manual (= Swofford 1991).

that group A-B- of this formula is an end group (see figs. 31 and 32): texts A and B can be connected to the chain of groups C-D- and E-F- in two ways. This is the cause of my hesitation. I do not see how it is possible to determine how A-B- must be connected to the C-D-E-F- chain part. In other words, my critique of van Mulken's (1993:58-62) decomposition proposal is that a group in a (highly frequent) quadruple is not necessarily an end group, with which a chain can be built.

We are confronted with two special problems concerning the automatized determination of the text tree of the fourteen *Lanseloet van Denemerken* text versions.

The first problem is that some of the text versions are heavily damaged and only show parts of the text. One text, G/DH=03, contains only about thirty verses, while another version, S/BO=14, has only the verses spoken by Lanseloet and Sandrijn, etc. Actually, not one variation place is available which occurs in all the *Lanseloet* texts. Therefore, no complete type-2 variations covering all fourteen text versions can be determined; there are simply too many missing variants in texts G/DH=03, A/BR=04 and S/BO=14. This is problematic, because, as a principle, we want to work with type-2 variations in which all the fourteen texts are present.

The second problem is that one text version, H/BR=01, often has a unique variant, which results in a complex variation with three groups: one group with the single member H/BR=01, versus two other true groups.[62]

We will treat both problems in more or less the same way. First, we will build type-2 variation formulas covering as many texts as possible, and act as if the damaged texts or text H/BR=01 were simply not delivered. We say that these texts have *missing variants* (see a.o. §4.7.4.1 and §4.7.4.2). By doing so, we get a pretty good picture of (a part of) the *Lanseloet* chain. Then, we will try to build in the damaged, fragmented text versions and H/BR=01 into that chain. If, for instance, the place of text version G/L=02 in the chain is clear and if some type-2 formulas show that text H/BR=01 and G/L=02 are an end group, we can determine the place of H/BR=01 in the chain quite accurately.

We will use the software package PAUP to build the chain of the *Lanseloet* texts. PAUP offers the possibility to use a question mark '?' for 'missing values', in our case 'missing variants'. As will be discussed near figure 88 in §4.7.4.2, PAUP ignores missing variants more or less. If a missing value for a text like H/BR=01 occurs, PAUP will look with the help of other variation formulas (in which H/BR=01 does have a value) to closely related text versions. If PAUP discovers that H/BR=01 and G/L=02 are an end group, it will give H/BR=01 the value of G/L=02 in case H/BR=01 has a missing value.

---

[62] Possibly van Mulken and I will study the possibility that complex variation formulas with precisely two true groups may be considered as a special kind of type-2 formula in the future. Maybe it will turn out, as we hope, that a complex formula like ABC:DEF:G:H can be rewritten as ABC:DEF, with two end groups A-B-C- and D-E-F-.

3.2.5. The Fifth Basic Principle; the Text-Genealogical Use of Differences in Word Order; Additions and Omissions of Words or Verses

The third text-genealogical rule in §3.2.3 says that 'the variation place must be kept as small as possible to avoid the danger that it contains several genealogical variants introduced during independent stages of textual transmission'. In other words, the rule stresses that a variation place must concern precisely one text-genealogical moment of change. Therefore, generally, it is adviced to use small units, single words, as variants, which may be entitled as *the single word boundary of the third rule*.

This single word boundary must be put into perspective, because this notion is sometimes an inaccurate summary of the third rule. The core of the rule is that a variant must concern one text-genealogical moment of change. Indeed such unique change often concerns one a single word. However, there are two possibilities in which a *text-genealogical moment* concerns a change in which not only single words are involved. First, it is possible that at one given moment the word order of a verse or sentence can be changed by a copyist. Second, again at one moment, a copyist can leave out or add one or more words or verses.

We assume that different word orders offer genealogical information. Naturally, these word orders have to be grammatical, as a result of the first genealogical rule. If we define *word order* as 'a left to right enumeration of single words', it is possible to formulate:

The (tentative) first rule or hypothesis on word order:

> When two or more (parts of) sentences or verses in text versions show the same (preferably three or more) words but in a different (yet syntactically adequate) order, the places in the text versions with the different order of words may be considered as genealogically informative variation places. The word classes to which these words belong are unimportant.

This rule is called 'tentative', because we will reformulate it later on in this section in a 'final' version of the rule. By definition, variation places with a change in word order must have a length of at least two words. While discussing the idiolectic parallelism in §3.2.1, we saw that the place of auxiliaries in Dutch in subordinated clauses may be rather arbitrary: '... dat hij *gestraft is*' and '... dat hij *is gestraft*' are both possible. The difference in word order of 'gestraft' and 'is' does not offer genealogical information. Therefore, it is preferable that a variation place with a change in word order involves more than two words.

I must admit that I have growing doubts about the text-genealogical value of differences in word order. According to Dr. M. van Mulken, with whom I discussed the tentative rule on word order, a change in word order can be a

regional or a diachronic, historical parallelism.[63] Presently, I agree with her criticism when the change in word order concerns adverbs. A superficial study of some old Dutch texts[64] convinced me that adverbial adjuncts, built from single adverbs that denote place, time, etc., take a rather free position in a sentence. Logically, when a difference in a word order merely consists of such adverbs, this can be a text-genealogically uninformative parallelism.

The question is how to treat differences in word order and other dubious text-genealogical characteristics. The procedure will be as follows. First, in §4.7, we will try to build a trustworthy *Lanseloet* tree from (nearly) indisputably correct variants. Then, in §5.3.8 (in which the word order characteristic will be evaluated), we will check whether changes in word order are in accordance or in conflict with the determined relationships of the text versions.[65] Possibly, we will find that changes in word order are parallelistic indeed. For the time being, at the end of the rule a restriction for adverbs is added:

The (final) fifth rule or hypothesis on word order, or the fifth hypothetical text-genealogical principle:

> **When two or more (parts of) sentences or verses in text versions show the same (preferably three or more) words but in a different (yet syntactically adequate) order, the places in the text versions with the different order of words may be considered as genealogically informative variation places. The word classes to which these words belong are unimportant, provided that they are not adverbs.**[66]

---

[63] See van Mulken (1993:28): "... Salemans assigns changes in word order too quickly to the genealogically significant category ('heavy weight variants'), since changes in word order can well be the result of dialectical translation."

[64] See Salemans & Wackers (1986); Salemans & Schaars (1987-...; 1990; 1993).

[65] For the moment, the computer only compares the word order of the base text (text version 02) with the word orders of the other texts. When, for instance, texts 06, 07 and 08 have words which are not present in text 02, but which do occur in texts 09 to 14, but in another word order, this difference in word order will not be detected. In other words, my automated approached of word order is *handicapped*, because it focuses on the word order in base text 02; therefore, it is possible that some type-2 word order variations will not be detected. (However, I checked whether important observations on word order were missing; they were not.) If the current (limited) word order observations are *promising*, i.e. text-genealogically informative, we can decide to enhance the word order function in the software. In order to enable a further study into word order as a text-genealogical phenomenon I decided to give in §8.2.2. of Appendix D (rejected) type-1 word order variations.

[66] A reviewer of this book asked whether the rule on word order implies that the difference between 'o vader mijn' and 'o mijn vader' is ungenealogical. The answer is affirmative. According to the rule, the difference in this word order does not provide trustworthy text-genealogical information, because the difference in word order considers only two and not three or more words. Therefore, it is perhaps better to scratch the word 'preferably' of the rule.

We have explained that differences in word order are not in conflict with the single word boundary. Perhaps the evaluation of this rule on word order, in §5.3.8, will show that differences in word order may not be used for the development of text-genealogical trees.

I am convinced that *omissions* or *additions*[67] (*interpolations*) often possess relationship-revealing power. Can we say that texts, showing the same hole or extra word(s), are genealogically related? Is an empty place in a text a variant?

Currently, it is unclear how a *hole* or *empty place* can be defined in, for instance, terms of single words. Preferably, variants are *positivistic*, observable.[68] This implies that one group of text versions contains one word, while the other group of text versions has another word. Generally, variants have a content and, therefore, are not empty. One could consider a hole in a text version as a *zero word*, a word without content. This is not an accurate solution. Of course, our fear is again that empty words in text versions are parallelisms, introduced at different stages in the transmission of a text. To put it differently, one empty word is not necessarily equal to another empty word. The fact that text versions show the same omitted words does not necessarily imply that they have a close text-genealogical relationship. This especially seems true for small, common (frequently used) words which can be easily omitted or added (see note 52). The danger of parallelism is less when the missing or added words are bigger, less common words. These words have a smaller chance to be introduced or left out by different copyists independently.

To detect whether the addition or omission of words in the *Lanseloet van Denemerken* text versions can be parallelistic, we will follow the procedure already mentioned. We will build the text-genealogical tree from sound variants, and then we will check whether omissions or additions of smaller and bigger words are in accordance with the determined relationships of the texts. Possibly, it will turn out that it is dangerous or 'forbidden' to use the absence or interpolation of small and bigger words as text-genealogical variants.

---

[67] For the development of a chain, the difference between omission and addition is not important.

[68] See also note 57, about the 'non-positivistic' detection of the *zéro caractéristique*. Suppose that we have seven text versions A to G and that their first sentences are 'And this is the first sentence' in texts A-B-C- and 'This is the first sentence' in texts D-E-F-G-. At first sight this seems to result in a type-2 variation formula ABC|DEFG: the first three texts with 'And' versus the other texts without 'And'. The 'zero spot' without 'And' in the four texts is not observable or *positivistic*. It is, for instance, possible that a ancestor text of texts D and E had 'So, this is the first sentence', while an ancestor text of F and G had 'Obviously, this is the first sentence'. The independent omission of the words 'So' and 'Obviously' resulted in the same line for texts D-E-F-G-, while these texts do not necessarily go back to the same common ancestor. Therefore, the correctness of the type-2 variation ABC|DEFG is doubtful.

For the time being, we conclude that the use of omitted words, especially small words, as text-genealogical informants is tricky. Can the same be said of omitted verses or prose lines? Omitted or interpolated verses or lines can offer us important text-genealogical information. As far as verses are concerned, we can assume that the verses in the original text all rhymed and that single, non-rhyming verses did not occur. When we are confronted with a non-rhyming verse, it is likely that we have spotted a change (in traditional Lachmannian terms: an error) introduced during the transmission of the text.

Suppose that the rhyme scheme looks like 'a-a-b-c-c-d-d'. The third verse, with 'b', does not rhyme - which, by the way, can be easily detected by a computer -, while the verses in its direct neighbourhood do. One possible explanation is that a second verse with 'b', possibly accompanied by verses 'x-x-etc.', has been deleted during the transmission of the text. It is also possible that the 'b'-verse (and accompanying verses) has been added, interpolated. However, for the development of the chain it is not important to know whether a 'b'-verse has been omitted or interpolated. If a single non-rhyming verse stands in the environment of correctly rhyming verses, it is likely that we have spotted a text-genealogical variance. Notice that I have more doubts about the text-genealogical value of absent/interpolated (small) words than of omitted or added verses. This is caused by my fear of parallelism; in most cases it will be easier for a copyist to introduce or leave out parallelistically a small word than a complete verse.

Another situation is that the rhyme scheme is like 'a-a-b-c-d-d-e-e': the third and fourth verse do not rhyme. Then, it is not necessary that a deletion or interpolation of a verse did occur. It is, for instance, possible that a rhyming word of one of the verses concerned has been deleted or took another place in the verses. But it is also possible that in the present example two verses ('b-c') did disappear. Other explanations could be suggested as well. We can take also into consideration that in texts certain verses, sentences, quotations, etc. may be repeated. The loss of these textual elements, can be easily repaired by a copyist. Then, their loss is text-genealogically unimportant.

Presently, I only want to propose that if a break in the rhyme scheme can easily be repaired by reordering a few words, thus implying a philological judgement, the break has no text-genealogical value. When it cannot be repaired easily, it does. The same can be argued with respect to the inversion of two rhyming verses. We conclude that the omission or interpolation or inversion of complete verses can sometimes be genealogically relevant.

The genealogical concepts presented are, partly, verse-oriented. This is due to the fact that the text versions of *Lanseloet van Denemerken* are written in verse. The advantage of working with rhyming verses instead of prose is that the rhyming words cannot be replaced by other words as easily as non-rhyming words in prose texts. When a copyist changes one rhyming word into a new word, he has to find a new rhyming word for it in the other verse. Thus, rhyming words seem to take stable positions and are key words in verses. The fact that verses generally seem

to have a more stable form than prose is, of course, convenient for text-genealogical research. Nevertheless, most characteristics may be applied in prose. Only characteristics 5, 9a, 9b, 10 and 11b can be used for rhyming texts. Future research must confirm that all the other characteristics work well in prose.

3.2.6. THE SIXTH BASIC PRINCIPLE; TEXT-GENEALOGICAL WORD TYPES

This section focuses on the question whether textual variants belong to certain syntactic or word categories. Theoretically and practically, it is more attractive to discuss and determine the genealogical power of a few word categories than to discuss the text-genealogical power of thousands of single words.

Many elements can be involved in the development of text genealogies, but the question is: which elements are genealogically informative? Besides textual variants, as defined by the first text-genealogical rule, bibliographical and codicological information on, for example, the use of pictures, lombards and paragraph signs in text versions, can possibly provide genealogical information. For pragmatic reasons, we only use textual variants as stemmatic building tools. The main topic of my Ph.D. research, based on the text versions of the Middle Dutch play *Lanseloet van Denemerken*, is to study how the computer can be used for text tree development. At the moment, the computer can easily detect textual differences between texts. The comparison of, for instance, pictures with the help of the computer (see Salemans 1994-95) is only in its initial phases.

It must be clear that, as a text genealogist, I am only interested in textual variations in text versions that provide us information on their historical transmission. The first text-genealogical basic rule defines such a kinship-revealing variant as: a textual difference that fits well in a text version and maintains (with a high probability) its form during the text transmission, except for small differences in the spelling.

The sixth, rather intuitive, rule or hypothesis is as follows:

The (tentative) rule or hypothesis on text-genealogical significant word types:

> Nouns and verbs are the most suitable word categories for building text genealogies; variants in rhyming position in verses, regardless of the word class they belong to, are text-genealogical as well.

Epistemologically speaking, it is not necessary to explain a hypothesis. It simply applies as long as it has not been falsified. The first four text-genealogical principles seem to be general text-genealogical ideas, about which we have few doubts. We have more doubts about the correctness of the fifth hypothesis on word order and the sixth hypothesis on text-genealogical word types.

Let us take a closer look at some elements of the sixth rule. First of all, the final phrase, 'variants in rhyming position in verses, regardless of the word class they belong to, are text-genealogical as well', claims that all the textual variants in rhyming position in verses are relationship-revealing. The word class they belong to is unimportant; variants in rhyming position can belong to other word classes than nouns and verbs. The idea behind this is that a rhyming word is one of the most essential parts of a verse, if not the most essential part. Even a creative copyist, who changes numerous elements of his source text, will be confronted with the fact that the verses he produces or copies have to rhyme. The change of a rhyming word has its implications for the rhyme scheme. Furthermore, the final position of rhyming words in verses attracts attention, which gives these words an even more stable position in the verses. When rhyming verse pairs in two or more text versions are different from the verse pairs at the same variation places in all of the other text versions, this will usually be highly informative.[69]

The choice for 'word categories' in rule six is related to the word-oriented third rule. This choice, however, implies that we will often need syntactic information to discover which word category a word variant belongs to. Unfortunately, no computerized syntactic and morphological analyzers, *parsers*, for the medieval Dutch dialects exist, nor do I have the opportunity to develop them. For the development of the *Lanseloet* tree, I built a thesaurus of non-text-genealogical words, using a concordance of the text versions. In this thesaurus, many word forms, especially the ones which are frequently used, are grouped in eight word categories: 1. adjectives; 2. adverbs; 3. articles; 4. auxiliaries or frequently used verbs; 5. conjunctions; 6. prepositions; 7. pronouns; 8. a mixed[70] category. When building type-2 variation formulas from the words occurring in the *Lanseloet* texts, the computer is programmed to reject a type-2 variation formula which concerns, for instance, an article or variants that belong to different word categories. In these cases, syntactic analysis does not seem to be strictly necessary.

---

[69] Notions like 'most of the time' or 'usually' are vague and unwanted in clear definitions or expressions. Nevertheless, I use the expression here to draw attention to the fact that rhyming words or verses can be additions or 'fill-ups' (the Dutch word is 'stoplappen'). Should a copyist be convinced that rhyming words in the exemplar he copies are corrupt, non-original, fill-ups, he or she may change them into new fill-ups. I thank Dr. W. Kuiper for this observation. Clearly recognizable fill-ups do not fit inconspicuously into a text and, therefore, violate the first text-genealogical rule, and do not have text-genealogical power. I realize that it will often be difficult for us to recognize and evaluate fill-ups. For this and other reasons a seventh text-genealogical rule or principle will be formulated in §3.3.2. Compare also the remarks of van der Wal on rhyming words in note 47.

[70] The mixed category contains homonymous words that belong to more than one of the first seven categories. For instance, a word like 'wilt', can be an adjective (in English: 'wild') or an auxiliary or a frequently used verb (in English: 'wants'). Logically, this word does not clearly fit into one specific word category. However, all that matters is that we know that it is not a substantive or verb, the word categories we are interested in. Admittedly, 'wilt' may be a substantive as well. But this word does not show up in a type-2 variation in the *Lanseloet* corpus. Therefore, we may put it in the non-substantive and non-verb mixed category.

The element 'most suitable' has been integrated to prevent the impression that the sixth hypothesis on text-genealogical word types forbids us to look at other word categories as text-genealogical informants. Suppose that one group of text versions read 'this man is always drunk', while the other group has 'this man is never drunk'. The opposition of the adverbs 'always' versus 'never' may offer sound text-genealogical information. Adjectives, which often play an inferior role in the meaning of a sentence, can be left out or added easily. Because the risk of parallelism is high, the category adjectives[71] is not mentioned in the sixth rule.

The choice for 'nouns and verbs' is derived from the first text-genealogical rule. The rule expresses that a textual element possesses *survival power* when it is plausible both that the element maintains its form during the text transmission and that it will not be submitted to (further) changes. For me, the word categories nouns and verbs are the fundamental lexical cores or semantic kernels of natural languages or dialects. They are generally expected in every verse or sentence. Word categories like articles, adverbs, conjunctions and, possibly, adjectives are more marginal and seem to play a more trivial role in the meaning of a statement. When nouns or verbs are omitted or misplaced, they are more likely to attract the attention of the copyist and to be, often successfully, corrected.[72]

Substantive nouns and verbs (and adjectives!) are so-called *open classes*. The other mentioned word categories, like articles and conjunctions, are *closed classes*, containing far fewer words. The open classes seem to be much more flexible; new words can be added or incorporated quite easily, while other words are removed from them because they are, for instance, obsolete.[73] The closed classes are less flexible (but not unflexible). Therefore, if we are looking for historical variation, it is more likely that such variation occurs in words belonging to the open classes.

Possibly, the importance of nouns and verbs can be made more plausible by pointing out that scientists down through the ages have claimed that nouns and verbs are the central elements of language. When we browse through the works of, arbitrarily, Aristotle,[74] Sapir,[75] and Chomsky, we can easily find quotations

---

[71] In an earlier version of this paper I stated, for instance, that nouns, verbs and adjectives are the main word categories that offer genealogical information. Later on, I decided to drop the adjectives because this word category in general does not take as stable a position in a sentence as do a noun or a verb. Furthermore, some adjectives (e.g. the pleonastic '*red* lips', '*white* teeth') are predictable and can be left out and added again easily, which implies a great danger of uninformative synonymous parallelisms. On the other hand some adjectives are so specific that the danger of a copyist introducing them spontaneously is acceptably low. My approach is as follows. First, we try to find type-2 variations built with nouns and verbs. If the variations are well spread, we will have enough chain-building material. If they are not, we must consider other word categories. Dr. P.A. Coppen brought to my attention that currently many linguists claim that the adjective has characteristics of both the noun and the verb.

[72] Evidently, the process of text copying by copyists and printers has to be studied (more) in depth.

[73] This observation seems to be confirmed by the research into the development of new words in the Dutch language. This research is described in van Oostendorp (1998).

[74] When I discussed the fundamentals of the rule with my promotor, Prof. Dr. G. Dibbets, he pointed

to this effect. In a recent study, Wetzer (1995) claims that adjectives are not a separate word class, but that they belong to the Noun and Verb classes.[76]

It would be interesting to measure the influence of categories like nouns, verbs, adjectives and articles when building a text genealogy. We assume[77] that the use of incorrect genealogical word categories, like articles, offer contradictory and inconclusive information on the shape of the stemma. The *consistency* or *trustworthiness* of a tree will be greater when better genealogical word categories are used. A so-called *Consistency Index* (CI) is used to express the solidity of a text genealogy. Fortunately, many genealogical software packages, like PAUP (see Part 3), offer instruments to measure the CI. By using these instruments, we can

---

out that the rule has a rather Aristotelian character (see Dibbets 1985:443). To quote Vorlat (1975:42-44), "[Aristotle's] basic distinction is one between 'kategoremata' and 'sundesmoi' ... . 'Kategoremata' are words with a lexical meaning and thus, according to Aristotle, able to function independently, or as head words in the sentence. 'Sundesmoi', on the other hand, are lexically empty, when standing in isolation. They perform nothing but a grammatical and dependent function with regard to the other category of words, whose functioning they guarantee in the sentence. Aristotle further classifies the lexically full words into 'onomata' and 'remata', i.e., nouns and verbs, as these terms have commonly been translated. This distinction is built on logico-philosophical grounds, viz. the belief that a logically built sentence must predicate an action of an agent. The 'onoma' is the name of the agent of which the action is predicated, whereas the 'rema' denotes the predicated action." For further information Vorlat refers to R.H. Robins (1951), *Ancient and Medieval Grammatical Theory in Europe*, London.

[75] See Sapir (1921), at the end of chapter V: "No language wholly fails to distinguish noun and verb, though in particular cases the nature of the distinction may be an elusive one. It is different with the other parts of speech. Not one of them is imperatively required for the life of language."

[76] *Nouniness* and *verbiness* are considered as central parameters in Harrie Wetzer's dissertation. Wetzer (1995:349-350): 'Comparative studies show that Adjectives do not constitute a universal category in language. While all languages seem to distinguish the categories *Noun* and *Verb*, many languages do not have a formally distinguishable open class of *Adjectives*. (...) In languages which are described as having a distinct Adjective class the status of this category is open to doubt. Typically, Adjectives share morphological and/or syntactic properties with nouns or with verbs. Thus, even if there are grammatical arguments for identifying a separate Adjective class in a particular language, this class will virtually never have an independent status comparable to that of the major word classes Noun and Verb. (...) Adjectives can be split up into two clearly distinguishable categories of 'noun-like' and 'verb-like' Adjectives. (...) [The] boundaries between Adjectives on the one hand and (adjectival) Nouns and Verbs on the other are arbitrary and extremely fuzzy, if they can be drawn at all. (...) [The] adjectival system of a language is typically attached to the nominal or verbal system of the language in question. (...) In this view, the category Adjective (...) is split up so as to be distributed among the other two categories of (adjectival) Nouns and (adjectival) Verbs.'

[77] Notice that I use the word 'assume' on purpose. The word stresses the hypothetical character of the concept. On p. 7, I explained that my text-genealogical ideas are hypotheses, which implies that they cannot be 'proved'. In chapter 5, we will evaluate my text-genealogical hypotheses and see whether they are confirmed, need to be adapted, or should be rejected.

analyze which word categories offer the most trustworthy genealogies.[78] This approach can be repeated for other texts. This repetition will provide the grounds for determining the best word categories for building text genealogies. This is a matter of interest for all text genealogists, also for those who do not work with computers. With this computer-generated material the sixth hypothesis on text-genealogical word types can be falsified or adapted. It is even possible to replace this deductive hypothesis with an inductive rule based on *empirical* CI-observations, although this does not seem to be necessary to me.

The strategy to build trustworthy genealogies is as follows. First, we will construct a theory about the elements in text versions that provide us with good information about the kinship of text versions. When we have serious, possibly subjective, doubts about the text-genealogical power of textual elements, like, for instance, the adjectives, we simply do not use them for the development of textual trees. Once the text-historical tree, which offers us a view of the historical relationship of the text versions, has been constructed, we can examine if certain elements, for instance the adjectives, are in accordance with this tree. Maybe we will find that the adjectival variants agree completely or partly with the produced historical tree. Then, we can decide to alter our theoretical ideas and incorporate the 'adjectives' into the hypothesis on text-genealogical significant word types.

The meaning of the categories 'nouns' and 'verbs' has to be limited to minimize the danger of parallelism. While discussing the synonymous parallelism in §3.2.1, we saw that pronouns are not trustworthy as text-genealogical informants. In the same section, we saw that the inflection of nouns and verbs can present false genealogical information, too. In the category 'nouns', only the substantives seem to have a stable form, except in its declination. Therefore, the tentative sixth rule can be reformulated as:

The (final version of the) sixth rule or hypothesis on text-genealogical word types:

> **Substantives and non-auxiliary verbs, regardless of declination or conjugation, are the most suitable word categories with which to build text genealogies; furthermore, variants in rhyming position in verses, regardless of the word class they belong to, are text-genealogically informative as well.**

[78] In §3.3.3, we will discuss characteristic 4b. When two words are competitive variants, this automated characteristic tries to find out whether one or both words belong to one of the eight *forbidden* word categories. If so, the software knows that they cannot be text-genealogical variants. If both words do not belong to one of these categories, for instance when they are substantives, they will not be filtered out by characteristic 4b. Once we have established a trustworthy text-genealogical tree with a high CI, in which the variants are not contradictory and fit well, we will evaluate whether the presumed non-text-genealogical categories, like for instance the adjectives, are in agreement with the tree. Then, we will draw our conclusions.

3.3. THE FORMALIZATION: REWRITING THE THEORY IN ELEVEN CHARACTERISTICS OF TEXT-GENEALOGICAL VARIANTS; THE SEVENTH TEXT-GENEALOGICAL PRINCIPLE

3.3.1. THE ELEVEN CHARACTERISTICS OF TEXT-GENEALOGICAL VARIANTS

In the previous sections, a theoretical framework of my personal (subjective) text-genealogical ideas or hypotheses was presented. In order to make these ideas verifiable, we will now derive eleven concrete, recognizable and verifiable characteristics of genealogical variants from them. This process of deriving (concrete) characteristics from the (more or less vague) theoretical ideas is called the formalization of the theoretical framework.

The characteristics will be illustrated by examples in figures 40 to 56. The examples are taken from the synoptic and diplomatic edition of the fourteen *Lanseloet van Denemerken* text versions, presented in Appendix C. The conventions within the synoptic edition are explained in Appendix B. A convention is, for instance, that all the verses are preceded by unique verse numbers. Each verse number consists of a text number (01, 02, 03 to 14) followed by a dot followed by a second (line) number. Text '01' represents the 'manuscript Van Hulthem' and text '02' the *Lanseloet van Denemerken* print of Gouda (± 1490). In many examples, elements have been marked or underscored to give them extra empasis.

Most characteristics will be illustrated by 'negative' examples, which demonstrate violations of the characteristics. In the search for text-genealogical variants, most characteristics act as filters. First, we look if a variant is in agreement with a certain characteristic x. If it is not, we know that the variant cannot be used for the development of a tree. If it is, we check if it is in agreement with the next characteristic y. *Et cetera*. The residue, variants that passed all the filters, agree with the characteristics of text-genealogical variants.

Characteristic 1: Text-genealogical variants belong to the same variation place.

Text-genealogical variants are textual differences, in preferably single words, that occur in the *same variation place*. (Source: first and third rule.)

```
02.8  Ay god here hoe mach dat sijn
01.44 @ Ay god here hoe mach dit sijn
05.8  Ay god heere hoe mach dit sijn
06.9  Och god heere hoe mach dat syn
07.9  Ooch got here hoe mach dat syn
08.9  Och got here wie mach dat syn
09.8  AY Godt Heere hoe mach dit zijn
10.14 AY Godt Heere hoe mach dit zijn
11.13 AY Godt Heere hoe mach dit zijn
12.15 AY God Heere hoe magh dit zijn/
13.15 AY God Heere hoe magh dit zijn/
03=>*
04.10 <A>Y god heere hoe mach dit sijn
14.3  Aij godt heere hoe magh dat sijn
```

```
Texts 01, 04, 05, 09, 10, 11, 12, 13 have ‘dit’, texts 06,
07 and 08 have ‘o(o)ch’. These variants are not competitive,
because ‘dit’ stands versus ‘dat’ and ‘o(o)ch’ stands
versus ‘ay’/‘aij’. Characteristic 1 forbids us to use the
variant couple ‘dit’ - ‘o(o)ch’ because the variants are
in different variation places. Characteristic 1 allows us
to use the competitive variants ‘ay’/‘aij’ - ‘och’/‘ooch’
because they are standing at the same variation place; the
same is true for the variants ‘dat’ - ‘dit’.
N.B.: the star in the verse of text 03 expresses that this
      verse is unknown to us because only fragments of the
      text have been delivered to us.
```

Figure 40. Example concerning characteristic 1: *Lanseloet* verses 02.0008.

Characteristic 2: Text-genealogical variants are part of *type-2 variations*. (Source: fourth rule.) Be aware that this characteristic is not bound to a (word) variant, like most other characteristics, but to a group of competitive variants.

```
02.172 Lieue moeder lieue vrouwe
01.215 Lieue moeder edel v(ro)uwe
05.173 Lieue moeder lieue vrouwe
06.174 Lieue moeder lieue vrouwe
07.174 Lieue moder lieue vrouwe
08.174 Lieue moder lieue frauwe
09.171 Lieve Moeder Lieve Vrouwe
10.178 Lieve Moeder lieve Vrouwe
11.180 Lieve Moeder lieve Vrouwe
12.179 Lieve Moeder lieve Vrouwe/
13.179 Lieve Moeder lieve Vrouwe/
03=>*
04=>*
14.158 lieve moeder lieve vrouwe
```

```
Text 01 is the only text with the reading ‘edel’. The other
verses have the variant ‘lieve’ (in different forms). If we
disregard the missing verses of the fragmented 03 and 04, we
can say that text 01 differs from texts 02, 05, 06, 07, 08,
09, 10, 11, 12, 13. Therefore, we have two competitive
variants, and one of them occurs in only one text. This is a
type-1 variation. Type-2 variations have two variants too,
```

but each variant must be present in two or more text versions. Characteristic 2 forbids us to use type-1 variations. In fig. 40 we see, e.g., two variants ‘dat’ and ‘dit’; these are the only two competitive variants and each variant occurs in two or more texts. Then characteristic 2 allows us to use such (type-2) variations.
Notice that variants can be forbidden for several reasons. Suppose that the variants ‘edel’ and ‘lieve’ would have occurred in a type-2 variation; characteristic 4b would have prevented us from using them. The computer performs the characteristics in a certain order, as described in §3.3.2.

Figure 41. Example concerning characteristic 2: *Lanseloet* verses 02.0172.

(Fig. 41 does not fit on one page: like some other figures, it is printed on more than one page. These split figures are easy to recognize: if a figure starts on a page and the caption below the figure is not visible on that page, the rest of the figure must follow on the next page.)

Characteristic 3: Text-genealogical variants stand in a grammatically adequate environment.

They must be *grammatically adequate* and positioned in a grammatically correct[79] context. (Source: first rule, element ‘fits well and inconspicuously’.)

02.675 Want mi dunct daer sijn maer een
01.697 Want en dunct mj maer een [637]
05.684 Want mi dunct daer en is maer een
06.686 Want myr dunct daer sy maer eyn
07.685 Want mir duncket daer sy maer eyn
08.685 Want myr duncket dayr sy maer eyn
09.681 Want my dunct daer zyn maer een/
10.689 Want my dunekt daer is maer een
11.694 Want my dunckt daer is maer een
12.691 Want mijn dunckt daer is maer een/
13.691 Want mijn dunckt daer is maer een/
03=>*
04.199 Want mi dunct daer en is maer een
14=>*

It is difficult to find an example in the *Lanseloet van Denemerken* text versions to illustrate characteristic 3, because most verses are grammatically adequate (see also §5.3.3 and fig. 158). Another problem is that in poetry it is sometimes acceptable to violate some grammatical conventions of regular (prose) language.

[79] The judgement whether a sequence of words or word groups is grammatically adequate or acceptable, can be different for poetry, like plays, and prose. Sometimes, in poetry the grammatical rules can be violated slightly and yet be acceptable because of rhythm and rhyme. Nevertheless, we can say, generally, that significant violations of grammatical rules in the poetry of the Middle Ages would have been unacceptable in the eyes of its readers and copyists.

Perhaps verses 02.675 and 09.681 are the only verses that are clearly ungrammatical. The singular subject ‘een’ is preceded by the plural finite verb ‘zyn’. Or should this be considered to be an example of an evident mistake, as dealt with by characteristic 6c? Be that as that may be, variant ‘zijn’ may not be used for text-genealogical purposes.

Figure 42. Example concerning characteristic 3 (or 6c?): *Lanseloet* verses 02.0675.

Characteristic 4 (4a & 4b): Text-genealogical variants belong to the same word categories of substantives or verbs.

4a. Text-genealogical variants belong to the *same word classes.*

4b. They are *substantives (= substantive nouns) or verbs,* except auxiliaries (in Dutch: ‘hebben’, ‘zijn’, ‘zullen’, ‘willen’, etc.)

(Source: sixth hypothesis; see for the auxiliary element §3.2.1 and note 49.)

02.185 Die ic woude hebben voer sandrijn
01.224 Die ic woude hebbe(n) voer sanderijn
05.185 Die ick hebben woude voor sandrijn
06.187 Die ich wolde hauen voer sandrijn
07.187 Die wolde hain voer sandrin
08.187 Die ich wolde hain vur sandrin
09.184 Die ic liever hebben soude dan Sandrijn/
10.191 Die ick liever hebben soude voor Sandrijn
11.193 Die ic liever hebben soude voor Sandrijn
12.192 Die ik liever hebben soude voor Sandrijn
13.192 Die ik liever hebben soude voor Sandrijn
03=>*
04=>*
14.162 die ick liever hebben soude dan sandryn

We see two competitive variants, each occurring in two (or more) text versions: ‘dan’ occurs in texts 09 and 14, while ‘voor’ is present in all the other delivered texts. This is a type-2 variation. Because ‘voor’ is a preposition, characteristic 4b forbids to use this variant. ‘dan’ is a conjunction, and 4b prohibits its use as well. Furthermore, both words belong to different word classes and are as such forbidden by characteristic 4a.

Figure 43. Example concerning characteristic 4a and 4b: *Lanseloet* verses 02.0185.

Characteristic 5: Text-genealogical variants can belong to other word categories when standing in rhyming position in verses.

(Source: sixth hypothesis.)

```
02.85  Draghen sonder dorper mnine in dien
01.121 Draghen sonder dorpernie
05.85  Drage(n) sond(er) dorperheit oft vilonie
06.86  Dragen sunder dorperminne in dien
07.86  Dragen sunder dorper minne in dien
08.86  Dragen sonder dorper mynne in dyn
09.84  Draghen sonder dorperheyt oft vilonie.
10.91  Dragen/ sonder dorperheyt oft vileynie.
11.91  Dragen sonder dorperheyt oft volonie.
12.92  Dragen sonder dorperheyd oft vylonie.
13.92  Dragen sonder dorperheyd oft vylonie.
03=>*
04=>*
14.80  draghe sonder dorperheijt of vylonie
```

The variant ‘dien’/‘dyn’ is not a (substantive) noun or a verb. Characteristic 4b forbids us to use such a variant. But characteristic 5 overrules 4b, because ‘dien’ is standing in rhyming position.

Figure 44. Example concerning characteristic 5: *Lanseloet* verses 02.0085.

Characteristic 6 (6a, 6b, 6c): Text-genealogical variants are not accidentals or small spelling differences.

The following textual differences are considered to be *accidental*, by which they cannot be used to build text genealogies with:

6a. Orthographical or diacritical differences.

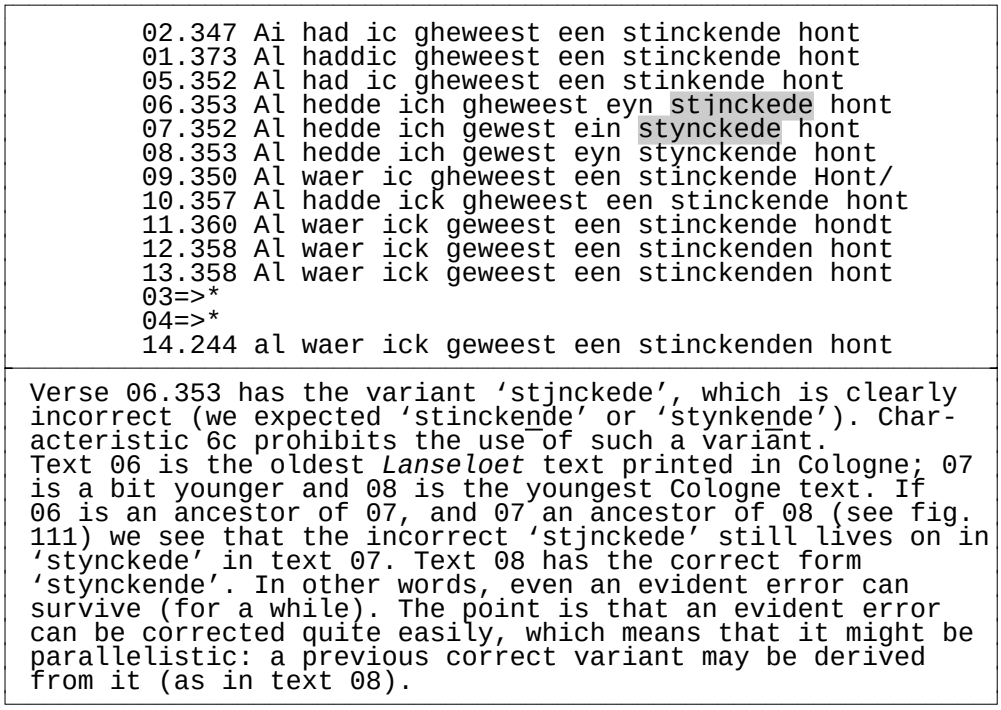
6b. Differences in word boundaries are considered to be orthographical and, thus, accidental.

```
02.959 Die een bloem daer af nam
01.986 Die ene bloeme daer af nam
05.969 Die een bloeme daer afnam
06.971 Die eyn bloem daer af nam
07.970 Die eyn bloem daer af nam
08.970 Die eyn bloem dair aff nam
09.966 Die een Blome daer af nam/
10.974 Die een bloeme daer af nam
11.980 Die een bloeme daer af nam
12.974 Die een bloeme daer af nam/
13.974 Die een bloeme daer af nam/
03=>*
04.355 Die een bloeme daer afnam
14.489 die een blomken daer afnam
```

In texts 04, 05 and 14 ‘afnam’ is one word; in the other texts it occurs as two words ‘af’ and ‘nam’. We say that the word boundaries differ. Characteristic 6b says that differences in word boundaries may not be used as variants to build text-genealogical trees. Notice that ‘Blome’ in verse 09.966 starts with a capital ‘B’. Such a trivial spelling difference is ruled out by characteristic 6a.

Figure 45. Example concerning characteristic 6a and 6b: *Lanseloet* verses 02.0959.

6c. Nonsense words, obvious slips of the pen or the typesetter, or clearly incorrect words (or word sequences that are semantically obviously incorrect) that can be changed quite easily into correct words (or word sequences).
(Source: first rule.)



02.347 Ai had ic gheweest een stinckende hont
01.373 Al haddic gheweest een stinckende hont
05.352 Al had ic gheweest een stinkende hont
06.353 Al hedde ich gheweest eyn stjnckede hont
07.352 Al hedde ich gewest ein stynckede hont
08.353 Al hedde ich gewest eyn stynckende hont
09.350 Al waer ic gheweest een stinckende Hont/
10.357 Al hadde ick gheweest een stinckende hont
11.360 Al waer ick geweest een stinckende hondt
12.358 Al waer ick geweest een stinckenden hont
13.358 Al waer ick geweest een stinckenden hont
03=>*
04=>*
14.244 al waer ick geweest een stinckenden hont
Verse 06.353 has the variant 'stjnckede', which is clearly incorrect (we expected 'stinckende' or 'stynkende'). Characteristic 6c prohibits the use of such a variant.
Text 06 is the oldest *Lanseloet* text printed in Cologne; 07 is a bit younger and 08 is the youngest Cologne text. If 06 is an ancestor of 07, and 07 an ancestor of 08 (see fig. 111) we see that the incorrect 'stjnckede' still lives on in 'stynckede' in text 07. Text 08 has the correct form 'stynckende'. In other words, even an evident error can survive (for a while). The point is that an evident error can be corrected quite easily, which means that it might be parallelistic: a previous correct variant may be derived from it (as in text 08).

Figure 46. Example concerning characteristic 6c: *Lanseloet* verses 02.0347.

Characteristic 7 (7a, 7b, 7c, 7d): Text-genealogical variants are not potential regional, ideolectic, diachronic or other parallelisms.

Textual differences are not genealogical when it is possible or probable that these differences are parallelistic. Apart from the accidental (orthographical) parallelism, mentioned here as characteristic 6, we recognize four other, not strictly monolithic, *types of parallelism*: inflectional parallelism ('is' - 'was'); synonymous and idiolectic parallelism ('white' - 'pale'); regional parallelism ('color' - 'colour'); diachronic or historical parallelism (see §3.2.1). To minimize the danger of parallelism, we formulate the following rules:

7a. The differences between genealogical variants cannot be mere differences in inflection. Therefore, the variants are converted into original *kernels* or *roots* (i.e., uninflected *basic lexical forms*, ignoring their gender, number, inflection and affixes), which can be found as *lemmas* or *entries* in dictionaries. Inflected word forms easily take other forms (e.g. 'was' - 'has been'; 'have' - 'had'). If we would use such word forms as genealogical variants, the danger of inflectional parallelism would be too great. (Source:

sixth hypothesis; §3.2.1: the types of parallelism.)[80]

```
02.802 Dat hi waer hectors van troyen ghelijc
01.825 Dat hi ware hgctors van troye(n) gelike
05.812 Al waerdi hector van troyen ghelijck
06.814 Dat he waer hectoers van troyen ghelijck
07.813 Dat he waer hectoers van troyen gelyck
08.813 Dat he were hectoers van troyen gelich
09.809 Dat hy waer Hector van Troyens ghelijcke
10.817 Dat hy waer Hector van Troyens ghelijcke
11.823 Dat hy waer Hector va(n) Troyen gelijcke
12.818 Dat hy waer Hector van Troyen gelijcke
13.818 Dat hy waer Hector van Troyen gelijcke
03=>*
04=>*
14.411 dat hij waer hector van troeyen gelijcke
```

```
Text 09 and 10 have 'Troyens' with a final genitive 's'. All
other texts have 'Troyen' without the 's'. Characteristic 7a
says that this difference in inflection may not be used.
Notice that texts 01 (with the evident, easily repairable
error 'hgctors'; we may use such a variant as if it was
'hectors'), 02, 06, 07 and 08 have 'hectoers' while all the
other texts have 'hector'. This variation is forbidden by
by characteristic 7a as well.
```

Figure 47. Example concerning characteristic 7a: *Lanseloet* verses 02.0802.

7b. The difference between variants or their kernels / roots must not merely be a (phonetic) difference in a *range of vowels*.[81] Textual differences that consist of mere differences in vowels always carry the danger of parallelism within them and can better be disregarded as text-genealogical variants. We are interested in substantial, heavy (non-trivial or non-accidental) textual differences with nearly undisputed text-genealogical power!

---

[80] A reviewer asked how I see the root of e.g. a unit like '*(ter) scolen*' (in English: 'in school'). Is it '*sc(h)ool*' or '*sc(h)ole*'? My answer is: both words may be seen as the root. Their difference is trivial, seen from a text-genealogical perspective. They both refer to the the same idea or entity.

[81] 'Difference in a range of vowels' has not been mentioned earlier. When we observe some Dutch medieval dialects, we see, roughly speaking, that many differences between regional words are differences in vowels, although changes in consonants also occur. I assume that changes in vowels do not alter the *word image* as much as changes in consonants do. Consonants are more characteristic for a word form than vowels (in Semitic languages, for example, texts are written without vowels). A copyist will often understand a word in another dialect if he or she transforms one or more vowels in it. The alteration of consonants in a word is a more difficult task, because there are more consonants than vowels. Because of the danger of parallelism, differences in vowels between words do not normally provide text-genealogical information. One could object that this treatment of vowels is not supported by theories, that differences in vowels between word forms are more complex and subtle, and that my vowel approach may sometimes cause incorrect rejections of good text-genealogical variants. Once we have developed dependable genealogical trees we can check if differences in vowels are indeed genealogically uninformative.

```
02.50 Heer lantsloet al ist dat ic v ghaerne sye
01.86 Al eest dat ic v g(er)ne mach sien
05.50 Heer lansloot al ist dat ic v gheerne sie
06.51 Heer lansloot is dat ich vch geerne seen
07.51 Heer lansloot ys dat ich vch gheerne seen
08.51 Here lanslot is dat ich vch gerne seyn
09.49 Heer Lanslot al is dat ic u gaerne sien
10.56 Heer Lantslot al ist dat ick u gheerne sien
11.54 Heer Lanslot al ist dat ick u gaerne sien/
12.56 Heer Lanslot al is 't dat ick u gaerne sien
13.56 Heer Lanslot al is 't dat ick u gaerne sien
03=>*
04.52 <He>er lansloot al ist dat ick v gherne sie
14.44 heer lanslot al is dat ick u geeren sien
```

```
Basically, we see two variants: the one with an 'a'-sound
'ghaerne' (in texts 02, 09, 11, 12 and 13) and an 'e'-sound
'gheerne' in other texts. Characteristic 7b says that this
difference in vowels is trivial/ungenealogical.
```

Figure 48. Example concerning characteristic 7b: *Lanseloet* verses 02.0050.

7c. The differences between variants cannot be mere differences between the different vocabularies of languages or dialects. All the variants must be words that are *generally known* in the languages or dialects of the text versions. This characteristic is mentioned to prevent regional, idiolectic and diachronic parallelisms (see §3.2.1); when variants are caused by differences in *languages* or dialects, they do not provide dependable genealogical information.

```
As will be explained in note 117, the Cologne texts 06, 07
and 08 prefer to speak of 'liefde', while the other texts
most often have the word 'minne'. This is illustrated in
fig. 52. It is likely that the Cologne printers/copyists
shared this dislike of the word 'liefde'. Thus, if the Co-
logne texts have 'liefde' and the other texts have 'minne',
characteristic 7c prevents the use of these variants.
```

Figure 49. Example concerning characteristic 7c: see fig. 52.

7d. The (cores of the) variants must be *rare*, in the sense that it is not likely that a variant can be easily interchanged with another variant. This rule attempts to prevent the use of synonymous parallelisms (see §3.2.1), like for instance variants of the *names*[82] of well-known people or things. Some *common* words can be easily turned into other more or less synonymous words, especially words that express an assertive act, like 'say', 'speak', 'tell', 'il fait', 'il dit'. Admittedly, the word 'rare' in this characteristic is rather abstract.[83]

```
02.262 Ic louet v bi sinte iohan
01=>@
05.262 Ick salt v ghelouen bi sint ian
06.264 Ich loue vch bier bi sinte iohan
07.264 Ich loue vch hier bi sente iohan
08.264 Ich loue vch hier by sente johan
09.261 Ic sal u gheloven by S. Ian/
10.268 Ick sal u gheloven by sint Ian
11.271 Ick sal u geloven by sint Ian/
12.268 Ick sal u gelooven by sint Ian/
13.268 Ick sal u gelooven by sint Ian/
03=>*
04.134 Ick salt v ghelouen bi sint ian
14.201 ick sal u beloven bij sint jan
```

We see two variants of the same name 'Saint John': 'iohan'/ 'johan' (in 02, 06 07, 08) and 'ian'/'jan' in the other texts. Characteristic 7d forbids us to use these variants.

Figure 50. Example concerning characteristic 7d: *Lanseloet* verses 02.0262.

---

[82] See also note 44, point j. In the Bible we read the names of the 'brothers' of Jesus. They are mentioned in Matthew (the Catholic 'Matteüs' and the Protestant 'Matthéüs') 13,55-56 and Mark 6,3. In the Dutch Catholic Bible 1975 Matthew calls them 'Jakobus, Jozef, Simon en Judas', and Mark 'Jakobus en Jozef en Judas en Simon'. In the Dutch Protestant Bible Matthew calls them 'Jakobus en Joses, en Simon en Judas' and Mark 'Jakobus en Joses, en (...) Judas en Simon.' Apparently, the Catholic Jozef is the same as the Protestant Joses. The point is that this demonstrates again that we must be careful in using variants of names as text-genealogical variants.

Sometimes a name may be well-known in one culture and unknown in other cultures. This can lead to interesting variants, not only in paper texts. In the 17th and 18th centuries the Europeans were deeply impressed by the porcelain produced in China. They ordered the Chinese to produce porcelain for them decorated with Western pictures, the so-called *Chine de commande*. On a dish produced in China we see a picture of Jesus on the cross surrounded by three sailors. Undoubtedly, this was the result of a French order to picture on a disk the three Mary's near the cross. The Chinese illuminator or one of his colleagues read 'maries' as 'marins', sailors.

[83] Concordance software can help us with this. For instance, let the computer produce a frequency list of words used in the total corpus of text versions. Take, for instance, the 150 most frequent words and determine the basic forms of these words: their roots. When in a place of variation both roots belong to the class of highly frequent roots, we should hesitate to use them as genealogical variants.

Characteristic 8: Text-genealogical variations in word order.

A difference in a syntactically adequate *word order* must be considered to be a genealogical variation, as long as the difference in word order does not merely concern a different placement of an adverb in a verse or sentence. (Source: the fifth hypothesis on word order.)

```
02.701 Hi riep dat hi hadde wel gheiaecht
01.724 En(de) riep hi hadde wel gheiaecht
05.711 Hi riep dat hi hadde wel gheiaecht
06.713 He riep dat he hadde wael gheiaecht
07.712 He riep dat he hadde wael gheiaecht
08.712 He rieff dat he hadde wail geiaecht
09.708 Hy riep dat hy wel hadde ghejaecht/
10.716 Hy riep dat hy wel hadde gheiaecht
11.721 Hy riep dat hy wel hadde ghejaecht/
12.717 Hy riep dat hy wel hadde gejaeght/
13.717 Hy riep dat hy wel hadde gejaeght/
03=>*
04.226 Hi riep dat hi wel hadde gheiaecht
14=>*
```

We see two different word orders: ‘wel’ after ‘hadde’ in texts 01, 02, 05, 06, 07 and 08, and ‘wel’ before ‘hadde’ in the other texts. Characteristic 8 says that this difference in word order may not be used, because ‘wel’ is an adverb. (Characteristic 8 will be evaluated in §5.3.8.)

Figure 51. Example concerning characteristic 8: *Lanseloet* verses 02.0701.

Characteristic 9: In verses, rhyming conventions must be obeyed.

9a. When text-genealogical variants are part of rhyming texts and are in rhyming position, they have to *obey (at least assonant) rhyming conventions*. (Source: first rule, element ‘fits well and inconspicuously’.) If they violate them, this may be due to the interpolation/omission of one or more verses. Such a deletion/addition can be genealogically important.

```
02.665 Ende al wt ghereehter minnen
01.687 En(de) al wt rechter mi(n)nen

13.682 O Godt Heer mocht ickse winnen/
03=>*
04=>*
14=>*
```

Cologne texts 06, 07 and 08 have ‘liefden’ while the other texts have ‘minnen’. These type-2 variants cannot be used, because ‘liefden’ does not rhyme with ‘vinden’ in the next verse: characteristic 9a forbids us to use them. Notice that variants can be forbidden by several characteristics. Here, characteristic 7c (see fig. 49) rejects the variants too.

Figure 52. Example concerning characteristic 9a: *Lanseloet* verses 02.0665 and 02.0666.

9b. A special case of the violation of rhyming conventions occurs when one verse ends with a certain rhyming word and the immediately following verse ends with the same word. The philologist must study these verses with *duplicate rhyming words* closely, because it is very likely that these verses or the surrounding verses contain an error which occurred during the transmission process. (Source: §3.2.5.)

```
02.232 Hebt ghedaen al v gheuoech
01.267 Hebt ghedaen al v ghevoech

```
We clearly see an inversion of verses. Characteristic 10
says that this is an important variation.
```

Figure 54. Example concerning characteristic 10: *Lanseloet* verses 02.0746 and 02.0747.

Characteristic 11 (11a & 11b): Addition and omission of words and verses.

11a. The *addition* (or *interpolation*) and *omission* of *words* is genealogically informative when these words fit well or offer no crucial information. Notice that the presence or absence of small frequently used words (like ‘so’) does not give text-genealogical information.

11b. The *addition* (or *interpolation*) and *omission* of complete *verses* is genealogically informative when these verses fit well or offer no crucial information.

If an added word fits well, it will not attract the attention of a copyist, by which the survival chances of the added word are good. Then, it can offer text-genealogical information. Analogously, if an almost meaningless word is left out, the copyist will not notice its omission. Then, the absence of the word may give text-genealogical information as well. As explained in §3.2.5, the

genealogical importance of additions or omissions has to be determined by a philologist. Often, he or she will have to study the wide context of the words or verses concerned, to judge whether words or verses fit well or offer crucial information.

Notice that the omission or addition of small, frequently used words (like 'so') can be parallelistic (see §3.2.1 and note 52). We could say that the frequency of a word is inversely proportional to its text-genealogical relevance. I consider characteristic 11b, concerning the addition or omission of complete verses, to be one of the most important characteristics.

```
02.425 Daer om bid ic v eedel baroen
01.451 Daer o(m)me biddic v hoghe baroen

```
The absence of verses in texts 09, 11, 12 and 13 can be
text-genealogically important, according to characteristic
11b. Notice that the absence of a verse (denoted with '@')
is different than the missing verses in a fragmented text
like text 03.
```

Figure 56. Example concerning characteristic 11b: *Lanseloet* verses 02.0039.

3.3.2. THE SEVENTH BASIC PRINCIPLE OF THE (TEMPORARY?) ROLE OF THE PHILOLOGIST

The *Lanseloet van Denemerken* text versions show tens of thousands of textual differences. Using the eleven characteristics we can determine which textual differences are genealogical. Judging and analysing all these differences manually is too laborious. Fortunately, almost all the characteristics can be detected *automatically* by the computer.

In the software, the *search order for characteristics* is as follows: 1 ('textual differences at the same variation place'), 2 ('type-2 variation'), 5 ('variants in rhyming position'), 9 ('obey rhyming conventions'), 6a ('orthographical differences')[84] and 6b ('differences in word boundaries'), 7a ('difference not caused by declination, etc.') 7b ('difference not only vowels'), partly 7c ('the variant must be generally known; variants caused by differences in languages are text-genealogically unimportant')[85], partly 7d ('the variant must be rare, and not be a too common word; variants of well-known names are text-genealogically uninformative')[86], 4a ('text-genealogical variants belong to the same word classes') and 4b ('text-genealogical variants are substantives or main verbs')[87].

Characteristic 8 to 11 deal with variation beyond the boundaries of single word variants. Observations about these characteristics are performed at a very early stage, when the computer is busy building a synoptic text from the fourteen

---

[84] Most of the accidentals are removed, because the software rewrites the texts in a more concise ('shorthand') form; see §3.4 and §4.2.

[85] In order to apply a part of characteristic 7c ('the variant must be generally known; variants caused by differences in languages or dialects are text-genealogically unimportant') I taught the computer to recognize some morphological trivial differences between the 'German' words in texts 06, 07 and 08 and the 'Dutch' words in the other texts. For example, when texts 06 to 08 have a word like 'grossen', while the other texts have 'groten', this is recognized by the software as a trivial variancy (see also Appendix D, §7.3.3).

[86] See Appendix D, §7.7.3.

[87] To enable the detection of characteristic 4, laborious preparations and adaptations were necessary. For the recognition of this characteristic (4a: 'same word classes'; 4b: 'verbs or substantives'), it was necessary to build, more or less by hand, a Dutch categorical word list (or 'thesaurus'). In this list non-substantive and non-verbal word forms have been tagged manually as adverbs, articles, etc. I used a computer concordance of the *Lanseloet van Denemerken* texts to build it. The thesaurus - printed in Appendix B, §III.a.4 - is not extensive or complete in the sense that all the non-substantive and non-verbal words are covered in it. It contains many common word forms, plus some extra ad hoc words. I added these extra words to the thesaurus after a few runs of my software had shown that the addition of certain words would provide more optimal results. Once the word list had been established, the detection of characteristic 4 was fully performed by the computer. It will be clear that if I would have had the possession of a parser, a computer program that can analyze the syntactic structure of a sentence and the morphological structure of words, and a dictionary, it would not have been necessary to develop the thesaurus.

Lanseloet texts. Characteristic 8 ('word order')[88] and 10 ('inversion of verses') are fully performed by the software, in the sense that no further philological-human interaction is needed. The detection of the interpolation or omission of words (= characteristic 11a) or verses (= characteristic 11b) has been automatized too. However, the final determination of whether the interpolation or omission of words is genealogical is left to the philologist. If the addition or deletion of verses is in accordance with the description in §3.2.5, the computer treats it well.

That leaves characteristics 3 ('grammatical adequacy') and 6c ('obviously incorrect words or nonsense words' or 'clearly incorrect words or word sequences that can easily be repaired'). If a parser for the *Lanseloet van Denemerken* and other texts existed, these characteristics would have been detected automatically as well. I decided to let the software treat the variants as if they never violated characteristics 3 and 6c. In other words, the basic attitude of the software towards variants is that they are standing in a grammatically adequate environment and that they are not nonsense words or erroneous slips of the pen. Once the software has offered us potential variation formulas, we will check then by hand whether characteristics 3 and 6c are violated in them.

The order of (the tests of) the characteristics may be confusing. I only saw the necessity of ordering the tests once I had started programming the characteristics.

Suppose that all the characteristics could be detected completely and absolutely error-free by the computer. Then, the discovered genealogical variants could be given to software like PAUP-3, that could build one or more possible text trees from this material. The question arises whether we should be satisfied with such a complete computerization of chain or stemma building. The answer is positive and negative. It is positive, because I have confidence in the power of the theoretical fundamentals (the rules and the eleven characteristics) in computer form. It is fascinating to see the computer perform a theory (or a theoretical recipe) accurately and produce one or more text trees. The answer is at the same time negative, because a philologist must give the final verdict on the computer-detected genealogical variants.

Several arguments support the last, negative answer. First, variants need to be checked as to whether these variants are indeed genealogical. Possibly, unexpected false variants occur in the variants found by the computer. If so, we can detect how and where the computer program, and, more importantly, the theory behind it, went wrong. Maybe we can sharpen or even reject the theory and the software, or parts of them. Second, the text-genealogical concepts and software are fundamentally word-oriented, even if parsers for this material were to exist.[89]

---

[88] For the moment, the automatized detection of differences in word order is slightly limited, because the software only compares the word order of the base text with the word orders of the other text versions. A more thorough search for all the differences in word order can and will be performed, if this limited search shows that this characteristic is indeed text-genealogical.

[89] At the moment, without the use of parsers, the software will reject from ninety-five to ninety-nine

Some variants have to be studied carefully beyond word level before they can reach the status of genealogical variants. A thorough (historical-)philological study of the surrounding context, of historical events, and of the development of dialects and language is often necessary.[90] Since this philological knowledge is not computerized, we need philologists to check the computer's efforts at developing an apparatus of variants with which text trees can be built (see for instance note 117). Especially as a warning to modern text genealogists, I formulate here the seventh genealogical rule, which is related to the earlier remark that true philologists need to regain fundamental influence in text genealogy:[91]

The seventh text-genealogical basic rule:

Genealogical variants must agree with (historical-)philological insights.

It may turn out that text-genealogical results will lead to the adaptation of some philological insights.

We must regard the automated text-genealogical characteristics as a set of filters. Only variants that slip through these filters are potentially genealogical. It is possible that some filters, and maybe the theoretical ideas behind them, do not perform their filtering tasks optimally. Therefore, some ungenealogical variants may get through the filters and incorrectly pop up as potentially genealogical variants.[92] This is not disastrous, since the seventh text-genealogical rule expresses that the philologist always has the last verdict on the text-genealogical value of computer detected potential genealogical variants. This is, of course, the reason why all the variants are called *potential* genealogical variants.

We may wonder whether it is possible that some good genealogical variants are filtered out by the software. This chance is negligible. As we will see in §5.2, the software detected all the variants mentioned by earlier scholars who developed *Lanseloet* trees. Furthermore, I checked the computer output by hand during a period of several weeks and did not find any incorrect treatments of variants.

---

percent of the textual differences as genealogical variants, because one or more genealogical characteristics are violated. I am pleased with this result. The computer filters out nearly all the uninformative variants from the tens of thousands of *Lanseloet* variants. Only a few hundred potential type-2 *Lanseloet* variations will remain which are worthwhile to check and study carefully.

[90] See, for example, characteristics 7c and 7d; see also §3.2.1.

[91] See also Salemans (1987:210) or Appendix E, at the end of §3.2.

[92] While running the software it was very tempting to adapt or improve some filters, so they would filter out some incorrect variants, that slipped through. It is, for instance, very easy to teach the computer that the difference between two variants 'boogaard' and 'boomgaard', i.e. the character 'm', is trivial. The disadvantage of adding hidden ad hoc elements to current filters is that we exclude further possibilities to improve text-genealogical concepts. In §5.1.2 of Appendix D, which I generated by hand, I present the ungenealogical characteristic 5 variants that slipped through the filters. Originally, these variants were part of §5.1.1 of that Appendix, in which the correct characteristic 5 variants are presented.

3.4. THE IMPLEMENTATION: DEVELOPING SOFTWARE FROM THE FORMALIZED THEORY

In order to draw the chain of the fourteen versions of *Lanseloet van Denemerken*, I developed several computer programs to find genealogical variants. These programs are described in detail in Appendix A: 'Description of the eight steps the software performs: from the fourteen single text versions to the (potential) variation formulas'. Therefore, I limit myself to a short description.

The goal of the software programs is to develop formulas for building the chain and the stemma of the fourteen *Lanseloet van Denemerken* texts. First, a synoptic or score text edition is created. In this edition, each verse of the arbitrarily chosen *base text*[93] 02 is accompanied by the corresponding verses of the other thirteen text versions. Second, the spelling of the words in the synoptic edition is simplified drastically. For example, diphthongs and triphtongs, consisting of two or more vowels, are rewritten into single character vowels. By doing so, we get rid of many orthographical peculiarities, which have no text-genealogical value. Of course, this simplified synoptic text must not be considered to be a phonetic representation. It is a simplified shorthand notation. (I could have chosen to let the computer rewrite every vowel or set of vowels into one arbitrary sign like '@'; however, the shorthand words would have become almost illegible. At present, the shorthand words give a reasonable, though not optimal, image of the original words.) Third, we let the computer compare the verses of this shorthand text, using the (automatized) text-genealogical characteristics described in §3.3.1. This results in a list of potential variation formulas, with which the text-genealogical tree can be built. Of course, we have to consider first whether the variation formulas are correct and in accordance with our philological insights, as prescribed by the seventh rule in §3.3.2. These three major parts of the analysis of the variants in the *Lanseloet* texts consist of eight steps. Schematically:[94]

---

[93] Generally, the choice of the base text is arbitrary. However, it is adviced to choose a (rather) complete text like text G/L=02 and not a fragmented text like S/BO=14. The software compares other texts with this base text. If the base text contains a *hole* where other text versions have lines or verses, all the software can do is to determine that the other text versions have additional lines or verses. The extra (as seen from the point of view of the base text) lines or verses cannot be compared with each other, because there is no reference text available in the base text. Possibly, the best choice would have been to use, in the case of *Lanseloet*, all the fourteen texts as base text and then to compare and collect the results. Currently, this would imply that I would have to run the software fourteen times, which would have been an immense job. Possibly in the future, my software will be improved and will be less dependent on the choice of the base text. Nevertheless, the choice of text G/L=02 as the base text did not result in genealogical variants that were not observed by the software, as I later verified. See also note 65.

[94] The software program TUSTEP created by Wilhelm Ott (see: Ott 1989), offers the possibility to develop a synoptic text from several text versions and an apparatus of variants of these text versions. TUSTEP is, therefore, an interesting alternative for the first part of my software, which generated a

PART 1: Create a synoptic or score text edition of the *Lanseloet van Denemerken* text versions

Step 1: Find the rhyming pairs of the fourteen *Lanseloet van Denemerken* text versions.
We run a program to analyze and describe the order of the rhyming words in the text versions. Each text version results in a long string of rhyming words. Verses are detected which do not rhyme (= characteristic 9).

Step 2+3: Take the rhyming pairs of text 02 as a basis (= step 2) and compare these with the rhyming pairs of the thirteen other texts (= step 3).

Step 4: Combine these thirteen comparisons into one scheme of all the rhyming pairs of the fourteen texts, taking the rhyming pairs of text 02 as a starting point. We use a program which detects inversions, omissions or additions of verses (= characteristics 10 and 11b).

Step 5: Find the rule numbers of the lines of the synoptic text on the basis of the complete scheme of all the rhyming pairs.

Step 6: Build the synoptic text, containing the original texts of the fourteen *Lanseloet van Denemerken* text versions, with the use of the detected rule numbers.

PART 2: Create a *shorthand text* from the synoptic text edition.

Step 7: Rewrite the synoptic text in *shorthand*, by removing and symplifying orthographical peculiarities.
A program produces the shorthand version of the synoptic text. We do not claim that the shorthand version offers a correct phonetic representation. The verses are only temporarily rewritten in shorthand to free them of trivial spelling differences which do not possess genealogical power (= characteristic 6).[95] In the final variation formulas with which the genealogy is built, the original, non-shorthand variants will be used again.

PART 3: Develop the variation formulas for building the text-genealogical tree.

Step 8: Detect text-genealogically informative type-2 variants, and develop (potential) type-2 variation formulas from them.
A program compares the words in the shorthand version of the synoptic verses, verse by verse.[96] Textual differences that occur in the same variation place (=

---

synoptic text of the *Lanseloet* texts. Unfortunately, TUSTEP is not user-friendly; according to Mathijsen (1995:407-411) and van Poortvliet (1993) it takes three weeks to learn how to work with TUSTEP properly. TUSTEP's automatically produced apparatus of variants is interesting as well. However, its merits for text-genealogical research must be put into perspective. The problem I faced, was not that it is difficult to produce an apparatus of variants, but that it is difficult to develop an apparatus of text-genealogical variants with which a text-genealogical tree can be built. TUSTEP does not perform a text-genealogical analysis of the variants.

[95] Striving to detect significant, *heavy*, variants with the aid of the computer, I do not want to be confronted with thousands of trivial accidental or parallelistic variants. The answer to the question whether it is necessary to use a computer to find these heavy variants is a simple 'no'. A philologist can often find numerous clear variants in texts without a computer; however, once the software has been developed, the computer can perform the search for the heavy, significant, variants more quickly, more thoroughly, and, above all, more systematically than a philologist. No heavy variants will escape the software's critical eye. Instead of tedious, fallible, and time-consuming browsing in text versions, the computer can find all the interesting variants within minutes.

[96] One text version is used as the *base text*. Each verse of the base text is compared with the

> characteristic 1) are easily detected. The program is word-oriented. Differences in word order (= characteristic 8) are noted. Additionally, on the basis of a thesaurus, developed with the help of the computer, a check is made to ascertain whether the words belong to, for the moment, forbidden word classes like articles, adverbs, conjunctions, pronouns (= characteristic 4b), and whether the differences are not merely vowels or aspects of inflection (= resp. characteristic 7b and 7a). Potential type-2 variant groups[97] (= characteristic 2) are detected and, on request, type-1 groups as well.

In Appendix A, these eight steps and all the computer programs are described in detail. In §4.3, step 7 and 8 are illustrated with some examples.

The end result of the programs will be a list of potential type-2 variation formulas from which a text tree can be built. These formulas have to be judged systematically by philologists, especially as to their grammatical (*characteristic 3*) and historical-philological adequacy. In the next chapter (§4.3), we demonstrate how the software works.

Once the characteristics were transformed into software, I used the first fifty lines of the synoptic *Lanseloet van Denemerken* texts to test, debug and refine the software. During this refining process, I discovered that the descriptions in words of the characteristics had to be refined as well. Therefore, sometimes the development of the software (to detect text-genealogical variants) and the refinement of the formulation of the theoretical fundamentals were simultaneous processes.

There is a danger in taking the first fifty verses of the score *Lanseloet* text to test and adapt the software and the theoretical thoughts behind it. When one studies these fifty lines, some eye-catching variants and, therefore, some families (like for instance the 'German' *Lanseloet* texts) of text versions seem to emerge. Unwillingly, one could adapt the theoretical concepts to make them agree with these presumed families. I tried to weapon myself against this seduction. I repeat that I developed the theoretical basis by reading and considering the text-genealogical ideas of other philologists. The first versions of my software in 1991 and 1992 were even not developed for application on the *Lanseloet* texts, but for

---

corresponding verses in the other texts. It is possible that the base text has a single verse where one or more of the other text versions show more verses, due to deletion or interpolation. This deletion or interpolation will be detected by the software at an earlier stage (step 2). The extra verses, not occurring in the base text, will not be compared with the single verse of the base text by the software. For the moment, for practical computer memory reasons, the word order in the text versions is only compared with the word order in the base text. See also notes 65 and 88.

[97] If two potential type-2 variant groups show other sigla (shorthand notations or characters to denote a text version) and if they cover together exactly all the sigla of the text versions, this combination is a potential type-2 variation (formula). Suppose that for seven texts A, B, C, D, E, F, and G the following type-2 variant groups are found: A-E-, D-E-F-, B-C-D-F-G-, A-B-C-. Then the only potential type-2 variation formula, covering all the sigla once, is: AE|BCDFG.

drawing the text-genealogical tree of seven medieval (French) versions of Chrétien de Troyes' *Yvain* (see: Salemans 1996). In other words, the core and basis of my theoretical ideas and the software were not especially related to *Lanseloet van Denemerken*. Only a special part of the software (see a.o. §4.1) is related to it: the thesaurus or word-list.

If one takes the first fifty verses as test case, to refine the software and the theory, it is possible that some ad hoc, corpus-related features are introduced in these programs and ideas. I tried to avoid that by not judging the resulting first variants and by not building a text-genealogical tree from them. Furthermore, fifty verses are a small part of the more than a thousand verses. In other words, the theoretical ideas and the related software programs are only slightly corpus-oriented (except for the thesaurus).

3.5. Conclusion and Summary

In chapter 2, several text-genealogical methods were presented. We saw that the nineteenth-century method of Lachmann builds stemmas based on common textual (unoriginal) changes. The difficulty of this method is that it is hard to find indisputably good, common unoriginal variants. Often, Lachmannians chose their variants on the basis of unverifiable, subjective intuition. The method of Lachmann has been criticized by many modern text-genealogists for this unscientific approach. However, subjectivity is not negative by definition. Subjective ideas are only unscientific if they are unverifiable and/or applied inconsistently.

We also discussed the advantage of modern text-genealogical methods, which prescribe two steps for building stemmas. First, the chain or a deep structure is built, using, usually, a large number of variants. The judgement as to whether the variants are original or not is not important during the chain-step, as long as the variants are part of type-2 variations. Second, the chain is oriented into a stemma with the use of a few original and unoriginal variants. This second step can be criticized for the same reasons as the method of Lachmann: it is difficult to determine the originality of a variant. However, modern methods require far fewer judgements about the originality of variants than the method of Lachmann.

In chapter 2, we studied the ways biologists order animals and plants. We made acquaintance with the influential cladistic ordering method and the cladistic software package PAUP. The cladists taught us that it is necessary to use relationship-revealing elements to build relationship trees. From this perspective, the cladistic method resembles the method of Lachmann, which, usually, works with a small set of chosen variants. On the one hand, the cladistic point of view does not stress working with as many variants as possible, like many modern text-genealogists seem to do, but using only those variants that provide information about the relationship between text versions. On the other hand, the cladistic biological ordering method uses the same two-step method to build genealogies as modern

text-genealogists: from deep-structures (chains) to surface structures (stemmas).

The consequence of our choice for cladistic text genealogy is that we must determine under which circumstances we can use a variant as a relationship-revealing variant for building relationship trees. We must not be blinded by modern text-genealogists, who work with large sums of variants and label their variants as *(objective) facts*. The cladistic criticism of their approach is that although their variants may be *facts*, it is often very disputable whether these variants are *text-genealogical facts*, in the sense that they provide information about text-historical relationships. In other words, we fear that the so-called *objective facts* may not be used for text-genealogical purposes.

Now, the question is which variants are text-genealogical, usable for the development of text-genealogies. We need a theory which describes good text-genealogical variants. Such a theory does not exist. In chapter 3, I tried to sketch some properties of variants to be used as tree building elements. I expressed my text-genealogical ideas in seven *principles*. They are not very balanced. For instance, the principle that in text-genealogical studies an apparatus of variants has to be presented, has a totally different character than the principle concerning word order. Therefore, *theory* is too grandiose a word for these seven ideas. I prefer to call them, a *theoretical framework*, which may be elaborated in the future. The first six principles of this framework are presented in §3.2. The seventh hypothesis is offered in §3.3.2.

The seven basic rules are:

1. a text-genealogical variant should be *stable* (for example, it should not be a parallelism);
2. a text-genealogical variant should be *verifiable*;
3. a text-genealogical variant should span a *minimal variation place*;
4. a text-genealogical variant should be *part of a type-2 variation*;
5. a text-genealogical variant involving *word order* spans preferably three or more meaningful words and does not concern adverbs; or:
6. a text-genealogical variant involves *nouns and verbs* only, or all the *words in rhyming position*;
7. genealogical variants must agree with *philological-historical insights*.

The seven principles have a subjective character, expressing my personal ideas about the way text-genealogies should be built. Subjective ideas are unscientific if they cannot be verified and if they are not applied consistently. Of course, I did not want to be accused of the same faults as the traditional Lachmannians. Therefore, I asked myself how I could make my ideas verifiable and how they could be performed consequentially. To answer the second part of that question, I know that the computer is an excellent, consistent performer. It can execute ideas, in the form of computer programs. If I could program my text-genealogical ideas into the computer, I would be assured that my ideas would be performed

consistently. Others could also use the computer output to verify my ideas.

However, if we want to enable the computer to recognize text-genealogical and false variants, the seven principles have to be rewritten into concrete characteristics of text-genealogical variants. This rewriting process is called the formalization process. In §3.3, the *formalization of the hypotheses* is described: eleven main characteristics (no. 1 to 11) and thirteen subcharacteristics (no. 4a, 4b, 6a, 6b, 6c, 7a, 7b, 7c, 7d, 9a, 9b, 11a, 11b) of text-genealogical variants are derived from the hypotheses. In summary:

- **Characteristic 1**: Text-genealogical variants belong to the same variation place.
  Text-genealogical variants are textual differences, in preferably single words, that occur in the *same variation place*.
- **Characteristic 2**: Text-genealogical variants are part of type-2 variations.
- **Characteristic 3**: Text-genealogical variants stand in a grammatically adequate environment.
- **Characteristic 4 (4a & 4b)**: Text-genealogical variants belong to the same word categories of substantives or verbs.
  4a. Text-genealogical variants belong to the *same word classes*.
  4b. They are *substantives (= substantive nouns) or verbs*, except auxiliaries (in Dutch: ‘hebben’, ‘zijn’, ‘zullen’, ‘willen’, etc.).
- **Characteristic 5**: Text-genealogical variants can belong to other word categories when standing in rhyming position in verses.
- **Characteristic 6 (6a, 6b, 6c)**: Text-genealogical variants are not accidentals or small spelling differences.
  The textual differences between text-genealogical variants can *never* be *accidentals*, like:
  6a. Orthographical or diacritical differences.
  6b. Differences in word boundaries are considered to be orthographical, and thus, accidental.
  6c. Nonsense words, obvious slips of the pen or the typesetter, or clearly incorrect, corrupt words (or word sequences that are semantically obviously incorrect) that can be changed quite easily into correct words (or word sequences).
- **Characteristic 7 (7a, 7b, 7c, 7d)**: Text-genealogical variants are not potential regional, ideolectic, diachronic or other parallelisms.
  Textual differences are not genealogical when it is possible or probable that these differences are parallelistic. Apart from the accidental (orthographical) parallelism, mentioned here as characteristic 6, we recognize four other, not strictly monolithic, *types of parallelism*: inflectional parallelism (‘is’ - ‘was’); synonymous and idiolectic parallelism (‘white’ - ‘pale’); regional parallelism (‘color’ - ‘colour’); diachronic or historical parallelism (see §3.2.1). To minimize the danger of parallelism, we formulate the following rules:
  7a. The differences between genealogical variants cannot be mere differences in inflection.
  7b. The difference between variants or their kernels / roots must not merely be

a (phonetic) difference in a *range of vowels*.

7c. The differences between variants cannot be mere differences between the different vocabularies of languages or dialects.

7d. The (cores of the) variants must be *rare*, in the sense that it is not likely that a variant can be easily interchanged with another variant. This rule attempts to prevent the use of synonymous parallelisms (see §3.2.1), like for instance variants of the names of well-known people or things. Some *common* words can be turned into other more or less synonymous words easily, especially words that express an assertive act, like 'say', 'speak', 'tell', 'il fait', 'il dit'.

- **Characteristic 8**: Text-genealogical variations in word order.
  A difference in a syntactically adequate *word order* must be considered to be a genealogical variation, as long as the difference in word order does not merely concern a different placement of an adverb in a verse or sentence.
- **Characteristic 9**: In verses, rhyming conventions must be obeyed.

9a. When text-genealogical variants are part of rhyming texts and are in rhyming position, they have to *obey (at least assonant) rhyming conventions*. (Source: first rule, element 'fits well and inconspicuously'.) If they violate them, this may be due to the interpolation/omission of one or more verses. Such a deletion/addition can be genealogically important.

9b. A special case of the violation of rhyming conventions occurs when one verse ends with a certain rhyming word and the immediately following verse ends with the same word. The philologist must study these verses with *duplicate rhyming words* closely, because it is very likely that these verses or the surrounding verses contain an error which occurred during the transmission process.

- **Characteristic 10**: Inversion of verses.
  The *inversion* of (the rhyming words in) verses is genealogical informative when these verses fit well in the text.
- **Characteristic 11 (11a & 11b)**: Addition and omission of words and verses.

11a.The *addition* (or *interpolation*) and omission of *words* is genealogically informative when these words fit well or offer no crucial information. Notice that the presence or absence of small frequently used words (like 'so') does not give text-genealogical information.

11b.The *addition* (or *interpolation*) and omission of complete *verses* is genealogically informative when these verses fit well or offer no crucial information.

During the *implementation* phase, the characteristics are transformed into computer programs, which is described in §3.4 and in Appendix A. After the implementation phase has been accomplished, the computer will be able to apply the characteristics, and thereby the *theoretical framework*, to the *Lanseloet* corpus.

4. APPLICATION OF THE METHOD TO THE *LANSELOET VAN DENEMERKEN* CORPUS

4.1. INTRODUCTION

Fig. 35 offers a sketch of my deductive approach to build and evaluate a text-genealogical theoretical framework for the development of the genealogical tree of the *Lanseloet van Denemerken* texts with the computer. That figure shows that my deductive approach consists in five steps: 1. formulate basic text-genealogical thoughts or principles; 2. formalize them into a theory with recognizable characteristics of variants; 3. enter or implement these characteristics into the computer, thus enabling the computer to perform the theory; 4. run this computer application and let the computer build a text-genealogical tree; 5. evaluate the results, the characteristics and the theory.

In the previous chapters we studied to the first three steps. In this chapter, we will discuss the fourth step. We will see the computer at work, performing the theory of text-genealogical characteristics using the *Lanseloet* text versions as input. The fifth step is the subject of chapter 5.

'Performing the theory' sounds very promising and ambitious. It must be stressed beforehand that the power of the software is somewhat limited, because it is corpus-oriented. By *corpus-oriented*, I intend to say that I developed the software knowing that it would be applied to the corpus of *Lanseloet* texts. What does this imply? This can be explained with an example. Assume that we wanted to use the software to develop the text-genealogical tree of the versions of the medieval *Karel ende Elegast* text. Which *Lanseloet* oriented elements in the software would have to be adapted?

As we know, characteristic 4b expresses that text-genealogical variants are, preferably, nouns and verbs. Normally, for the automatic detection of these and other word categories a computer parser is needed, which can give a syntactic and morphological analysis of the verses and their words. Since such parser for the analysis of texts from about 1400 to 1700 A.D. is not available, and its development would have taken many years of work, I decided to build a computer thesaurus of *Lanseloet* words. This thesaurus, developed from an alphabetical concordance and a list with frequently used words, contains only a few hundred words plus the word categories they belong to.[98] The analytical pseudo-parsing power of the word-oriented thesaurus is therefore limited. Nevertheless, it works quite well for the *Lanseloet* texts, as we will see. However, if we want to run the software with the *Karel ende Elegast* text versions as input, the word-oriented thesaurus will need to be adapted.

---

[98] See footnote 87. The thesaurus is based on a computer-generated concordance (I used my *Concorde* software package, with which I created the concordance of all the 32 plays of Joost van den Vondel; see Salemans & Schaars 1990) concerning the fourteen *Lanseloet* texts. The thesaurus is quite simple, because knowledge of conjugations (etc.) is not incorporated in it.

There is a second corpus-oriented element in the software. Characteristic 6a states that we are not interested in small spelling differences. In the Middle Ages, one universally accepted, orthographical system for the Dutch language(s)/ dialects did not exist. A single word could have several possible spellings. I did not want to be hindered by these trivial, parallelistic, orthographical variants; therefore, I taught the computer to rewrite the *Lanseloet* verses in a kind of shorthand notation, in which most orthographical differences are simplified. Although the rewriting rules are corpus-oriented, they need little or no adaptation when applied to the *Karel ende Elegast* corpus.

Apart from being corpus-oriented, the software is limited in another way. This second limitation concerns another aspect of the *Lanseloet* thesaurus. This thesaurus consist of many word categories but does not contain the categories nouns and verbs, precisely the word categories we are interested in. In other words, the only words the computer can recognize with the use of the thesaurus belong to non-genealogical, word categories. Nouns, and especially verbs, are rather *open categories*, taking their flexions into consideration. It is quite difficult to teach the computer all the forms of the verbs occurring in the *Lanseloet* texts. Ungenealogical word categories like articles or conjunctions are more *closed*; they can be enumerated and recognized far more easily. If we can teach the computer to recognize and filter out all the non-genealogical word categories, we hope that the residue of unrecognized words belong to the undefined verb and noun categories. Of course this residue has to be checked by a philologist.

As stated earlier, we will see the computer software at work in this chapter. We know that the software has limited powers, since a syntactic-morphological parser is not available. The somewhat handicapped software will find and judge the thousands of variants occurring in the *Lanseloet* text versions as prescribed by the theory with its characteristics of text-genealogical variants. We will see that the software will reject, or filter out, most variants: only 239 variants are found that are in agreement with the characteristics of *good*, text-genealogical, variants. The seventh text-genealogical basic rule (see §3.3.2) orders us to study these variants: ‘Genealogical variants must agree with (historical-)philological insights.’

The tree can and will be built in two ways. We will use our own algorithm, described in §2.4.4, and we will use the cladistic software package PAUP. If both ways lead to the same tree as an end result, we can be fairly sure that the end result is trustworthy.

Before we look at the software at work, we will present some bibliographical information on the fourteen *Lanseloet van Denemerken* text versions. It is claimed that bibliographical investigations are not obligatory but are an essential part of text-genealogical research. In the next section, §4.2, we will introduce the fourteen versions and give a summary of the contents of the *Lanseloet* story.

4.2. SHORT DESCRIPTION OF FOURTEEN *LANSELOET VAN DENEMERKEN* TEXT VERSIONS AND THEIR CONTENTS; BIBLIOGRAPHICAL REMARKS

Fourteen *Lanseloet van Denemerken* text versions are described by Roemans & van Assche (1982:45-53). 'R&A', as I will call them occasionally, use sigla, like 'G/L', 'G/DH' to denote the text versions. These standard sigla only refer to early printed incunable (i.e. dating from before 1500 A.D.) and postincunable (i.e. dating from between 1500 and 1540 A.D.) *Lanseloet* texts. For the texts from a later date and for the 'manuscript Van Hulthem' I invented analogous Roemans & van Assche (1982)-like sigla. For pragmatic reasons, dealing with computer programming, I worked with my own numerical sigla: '01', '02' to '14'. Both types of sigla are presented in fig. 57. The sigla can also be found in the first part of Appendix B. Often I will combine the Roemans & van Assche (1982) codes with my own sigla. For instance, text 'G/L' or '02' can become 'G/L=02'. *Lanseloet* texts H/BR=01 and S/BO=14 are manuscripts. The other twelve are imprints. The fourteen text versions are presented in fig. 57. This figure needs some explanation.

What is the *Lanseloet van Denemerken* story about? The young knight Lanseloet falls in love with Sandrijn and wants to make love to her. His mother does not approve the love affair between her son and her servant, because Sandrijn is of low birth. The mother has a vicious plan to end the affair. She goes to Lanseloet and tells him that she will send Sandrijn to his room and that he can do with her as he pleases, but there is one condition. Lanseloet must promise to his mother that after his deed he will behave as follows: he will say to Sandrijn that he has enough of her, turn his back to her, and start sleeping. Lanseloet is surprised by the condition, but accepts it. Then, the mother goes to Sandrijn and asks her if she wants to visit Lanseloet in his room, because he is ill. Lanseloet and Sandrijn meet and make love. Lanseloet acts as promised, by which Sandrijn is very upset. She feels 'mistreated like a dog' and leaves the country. In the fields of a foreign country she is found by a Knight, who is out hunting. She tells him in guarded terms what happened to her. The Knight accepts the story of Sandrijn, who compares herself with 'a tree from which a bird took only one flower'. He takes her with him to his court. Meanwhile, Lanseloet regrets what happened. He sends his friend Reinout out to find Sandrijn and bring her back to him. During his search, Reinout meets the Knight's gardener. He brings Reinout into contact with Sandrijn. Sandrijn is happily married and does not want to return to Lanseloet. After some hesitation, Reinout tells Lanseloet the bad news. Subsequently, Lanseloet dies of sorrow.

	'Manuscript 's-Gravenpolder', 1684-1720; (Archives of) Borsele (in the Dutch Province of Zeeland); manuscript, containing the roles of Lanseloet and of Sandrijn; therefore, an *incomplete* text version; the other roles, of e.g. Reinout, are not present.	

Figure 57. Sigla of the *Lanseloet van Denemerken* text versions. The left column offers my computer sigla. The right column gives the sigla by Roemans & van Assche (1982) (or, in bold italics, analogous Roemans & van Assche (1982) codes produced by me). The middle column has been derived from Roemans & van Assche (1982).

For the transcription of the *Lanseloet van Denemerken* texts into computer files, I used good photographs and photocopies of these texts. From 1985 to 1998, I visited twelve libraries in Europe to see the *Lanseloet* text versions.[99] We may ask why it is necessary to see the texts ourselves while we have splendid photos of them. Do visits to libraries and bibliographical research have text-genealogical benefits? This is almost a rhetorical question. As text-genealogists, we want to detect the historical deliverance and relationships of text versions. Therefore, we must be interested in all the (bibliographical) aspects of the texts.

The problem with pictures is that they are two-dimensional ('2D'), while in codicological[100] and bibliographical investigations three-dimensional ('3D') aspects are important as well. We want, for instance, to look through the pages to see the watermarks and chain-lines in the paper. And we also want to see how the the gatherings (see note 102) are composed. These 3D aspects[101] are crucial for the determination the *bibliographical format*[102] of a text version. Important

---

[99] I visited the Royal Library in Brussels (with *Lanseloet* texts H/BR=01 and A/BR=04), the Royal Library in The Hague (G/DH=03), the Bayerische Staatsbibliothek in Munich (A/M=05), the Herzog August Bibliothek in Wolfenbüttel (K/W=06), the Niedersächsische Staats- und Universitätsbibliothek in Göttingen (K/G=07), the University and City Library in Cologne (K/K=08), the University Library of Liège (A/LI=10), the British Library in London (R/LO=09), the Library of the Museum Plantin Moretus in Antwerp (A/A=11), the National Library in Paris (U/P=12) and the University Library in Leiden (U/LE=13). I studied the 's-Gravenpolder text version (S/BO=14) with the roles of Lans(e)lot and Sandrijn - presented in Hüsken & Schaars (1984) - when it was in the Library of the University of Nijmegen around 1980. Text version G/L=02 disappeared during the Second World War out of the Library of Lübeck. It can only be studied through the facsimile by M. Nijhoff in 1902, which is in my personal library.

[100] Voorbij (1996) demonstrates that a codicological study of text versions may lead to interesting text-genealogical conclusions. He detected certain documents which reveal information about the deliverance of text versions he studied.

[101] Even if high-quality photographs existed, and were available on the Internet (as has been promoted in Salemans (1994-95)), the 3D problem would still exist. I guess that, finally, the 3D-problem can only be solved by a molecular or atomic description or (spectroscopic) scan of book per cubic nanometre. That would be the ultimate bibliographical description of a text. With such a description and with much more powerful computers and computer networks, we would be able to manipulate the text versions on our own computers, as if they were in front of us or in our hands.

[102] As we know, books consist of gatherings. Roughly speaking, each gathering is a large sheet of paper that is folded several times. For instance, if the sheet is folded twice, the result will be a gathering or small booklet of four papers (with eight sides or pages). The *bibliographical format* of a (book) gathering expresses how many times and in what ways a sheet has to be folded to give a gathering a certain number of pages, and a certain height and length: unfolded gives the *plano*, folded once the *folio*, folded twice the *quarto*, folded three times the *octavo*, etc. If a printer wanted to produce an octavo, he laid the large sheet on his printing press and printed eight page sides on it; then he turned the sheet and printed the other eight pages. Of course the pages that had to follow each other in the ultimate book were not printed side by side on the sheet. Therefore, the printer had to calculate the correct *imposition* of the pages within the gathering. If he wanted to print a book with several gatherings, he had to plan to use his large paper sheets as economical as possible: it would have been a waste of paper if, for instance, one large sheet had to be used for only a few

textual variants may occur near the end of gatherings,[103] which demonstrates the text-genealogical importance of bibliographical investigations.

Furthermore, we cannot completely trust the accuracy of photographs (or photographers). Since the originals always give the best information, autopsy of the originals is necessary. This can be illustrated by two simple examples. Before I visited the Royal Library in Brussels to see *Lanseloet* text A/BR=04, I had studied and transcribed it already with the use of good photographs. I was convinced that the photographer had photographed all the pages of the text version. The autopsy of the text version taught me that four photographs of four pages were missing. These four extra pages, bound together at the end of the booklet, are the same as four pages printed earlier in the book and do not offer new (textual) information.[104] The second example demonstrating the virtue of autopsy, concerns text A/M=05. Again, I had also good photographs of the text, not of the complete book. My visit to the Bayerische Staatsbibliothek in Munich showed that the inside of the paper cover of A/M=05 contained interesting notes or traces of use. This fact is not new, since it has been remarked already by Resoort (1976-1977).[105] My point is, again, that I was fooled a bit by the photographs: they were photographs of the text, but not of the paper cover.

The third reason to visit texts in libraries is that we must always check whether the existing or acknowledged bibliographical descriptions are correct. The descriptions of the *Lanseloet van Denemerken* texts as offered by Roemans & van

---

lines of text on the last page of a book. When he miscalculated, a shortage of space at the end of the gathering was the result. Then he took measures. For instance, he moved or even removed parts of the text (in lead form). Thus, important textual variants may occur near the end of gatherings.

More detailed information about the (bibliographical) format of books can be found in the chapter *Imposition* of Gaskell (1979:78-117). Gaskell teaches that for the determination of the bibliographical format we must know the direction of the chain-lines, the position of the watermark, the number of leaves per gathering and the dimensions of the uncut leaf.

[103] We must realize that copies of a book, for instance produced by different printers, may contain other types of gatherings. Then, the border or end of a gathering in one book, may be not the border of a gathering in a another book.

[104] A close comparison of both sets of four pages showed that it is very likely that they derive from the same edition. It cannot be excluded that the four extra pages belonged to two different exemplars, which would mean that the booklet may have been built from three exemplars of one edition. The four extra pages must have been part of the final, third, gathering of the book. The quality of the paper of the first two pages is different from the quality of the last two pages. Furthermore, the many (worm)holes in the margins of the first two pages, do not correspond with the almost holefree margins of the last two pages.

[105] Furthermore, Resoort (1976-1977:324) warns us that in facsimile editions from the beginning of this century notes, marks, or other traces of use were often retouched for aesthetic reasons. Analogously, I warn that we even have to be careful with facsimile editions of more recent date. For the production of Salemans & de Bonth (1990-91) I used, in first instance, the facsimile edition of Beatrijs (1986). When I visited the Royal Library in The Hague to see the original Beatrijs manuscript (signature: 76 E 5), I was very surprised to see that the manuscript's margins (with illuminations in them) were much larger than margins in the facsimile edition.

Assche (1982:45-53) are fairly adequate. However, they do not mention *bibliographical formats* (see footnote 102). Roemans & van Assche (1982) offer, as Carter (1980) calls it, *bookseller's formats*.[106] This type of format informs us about the size of the book: an octavo is a book with a length until, say, 25 cm, a quarto has a length of 25 to 35 cm, and a folio is more than 35 cm long. I do not criticize Roemans & van Assche (1982) for offering us bookseller's formats. This was (and is) common practise.[107]

Roemans & van Assche (1982:45-53) label text versions G/L=02, A/BR=04, A/M=05, R/LO=09, A/LI=10, A/A=11, U/P=12 and L/E-13 all as 'Boekje in-4°', a booklet in quarto format, while text 03 is described as a part of an 'incunabel in-4°'. I present here some superficial, additional remarks about the bibliographical formats of the *Lanseloet* text versions,[108] based mainly upon Gaskell (1979).

Text version H/BR=01. The manuscript Van Hulthem, dating from about 1400 A.D. or the first part of the fifteenth century contains 241 paper folia from about 265 by 200 mm. The manuscript was restored in 1997 and 1998.

Text version G/L=02. We only have a facsimile edition of this text version in our possession.[109] Because the signatures[110] of the pages are available to us, we can

---

[106] See the description of the term *Format* in Carter (1980:103-104): 'In bibliographical contexts it is used to indicate the size of a volume in terms of the number of times the original printed SHEET has been folded to form its constituent leaves: modified when necessary by the subsequent make-up. Thus in a folio each sheet has been folded once, in a quarto twice, in an octavo three times; the size being thus respectively a half a quarter and an eighth that of the original sheet.' Carter expresses that this *bibliographical format* is a quite technical, difficult notion, that is unfamiliar to many people. On the same pages he states that most people are more familiar with a more *rough shape format*, which may be called the *booksellers' format*: 'But most booksellers' catalogues nowadays dispense with a terminology which is increasingly unfamiliar to, and unnecessarily technical for, the majority of their readers. These know - or should know - that, from the early 17th century at least, a folio is a large upright-shaped volume and an octavo a small upright-shaped volume, while a quarto (between them in size) is essentially squarish in shape.'

[107] Roemans & van Assche (1982) refer to Borchling & Claussen (1931-36, Band I: nr. 487, p. 1510) for the description of K/K=08. Borchling & Claussen mention as the format of this book '4°', while they provide a 'Sign.' as well: 'A^6 B^4-D^4'. In other words, Borchling & Claussen, and therefore Roemans & van Assche (1982) as well, must have been aware of the difference between the bibliographical and the bookseller's format.

[108] Nowadays, professional bibliographers develop *fingerprint formulas* as parts of their bibliographical descriptions. I did not, for two reasons. First, as I demonstrated in Salemans (1994-95:137), the fingerprint system does not seem to be solid or trustworthy enough, since it may lead to different fingerprints for the same editions. (Perhaps I was too pessimistic about the system's virtues.) Second, building fingerprint formulas is a quite complex task, especially if pages in text versions are missing. I would like to thank Dr. R. Arpots (Library of the University of Nijmegen), Dr. R. de Bonth (University of Nijmegen), Drs. P. Dijstelberge (Library of the University of Utrecht), Drs. A. Schmidt (Library of Maastricht), Dr. P. Verkruijsse (University of Amsterdam) and dr. I. Weekhout (University of Nijmegen) for their kind bibliographical advices.

[109] Possibly, in the facsimile edition of Nijhoff it is not tried to maintain the original setting of the

determine the number of leafs or sheets of the gatherings. The first two gatherings might have had six papers, while the last two gatherings might have had four papers. Therefore, it is likely that the book is a *mix* of *duodecimo gatherings in half-sheets* (or '12^{o} in 6s, 2 sigs.'; see Gaskell (1979:fig. 58)) and, perhaps, of *quarto gatherings*.

Text version G/DH=03. It is difficult, if not impossible, to determine the type of the gathering as only one sheet of this text is available. The size of the paper (17.8 cm x 12.3 cm) and the direction of the chain-lines - there is no watermark visible - are similar to those of a *duodecimo gathering in half-sheets* (see: Gaskell 1979:figs. 55-59).

Text version A/BR=04. As mentioned in fig. 57, many pages of text A/BR=04 have disappeared.[111] As we will see in §4.7.3 and §4.8.3, texts A/BR=04 and A/M=05 are closely related. If we compare the available pages of the fragmented text A/BR=04 with the ones of the complete text A/M=05, we see that it is likely that both text versions have had the same set of gatherings. My study of text version A/BR=04, showed that it consists of three gatherings each containing six leaves: *duodecimo gatherings in half-sheets*.

Text version A/M=05. This text[112] consist of three *duodecimo gatherings in half-sheets*.

Text version K/W=06. Again the determination of the direction of the chain-lines, the position of the watermark, the number of six papers per gathering and the dimensions of the papers, lead to the conclusion that K/W=06 consists of three *duodecimo gatherings in half-sheets*, which is mentioned by Claussen (1957:nr.342,p.51) as well.

Text version K/G=07. Borchling & Claussen (1931-36,Band I:nr.487,p.1510) say that the first gathering of the text is a *duodecimo in half-sheets*, while the following three gatherings have the *quarto* format. This was confirmed by my visit to the library in Göttingen: the first gathering has six papers, while the following three gatherings each have four papers. However, Gaskell (1979:85) teaches that four papers per gathering may point to octavo or duodecimo formats as well. In the case of text K/G=07 it cannot be excluded that the last three gatherings are *duodecimo gatherings in half sheets*.

---

original gatherings. For instance, in the lost original text version G/L=02 the page with the signature 'b i' might have been the first page of the second gathering, while this page is in the middle of a gathering in the facsimile edition. Notice that I say 'might have been' and not 'must have been'. My reason for caution is that in text version K/K=08 the page with the signature 'b i' is in the middle of the second gathering and not at the beginning.

[110] Signatures are the characters printed in the bottom margin of the first leaf (or leaves) of each gathering of a book. The binder uses signatures as a guide to assemble the gatherings correctly.

[111] On many pages of the fragmented text A/BR=04 words or parts of words have disappeared due to holes in the pages or completely missing pages. However, the printer Adriaen van Berghen used a lot of (thick) ink of possibly poor quality: often we can see the characters of the opposite page in mirror image. (Apparently, the folded sheets - or: gatherings - did not have enough time to dry.) Furthermore, at the end of A/BR=04 an extra part of one or two other A/BR=04 texts (most likely from the same edition) are presented. The parts concern C1r (more or less visible verses: 04.196, 04.202-04.210), C1v (more or less visible verses: 04.227-04.253), C2r (more or less visible verses: 04.259-04.285), C2v (more or less visible verses: 04.293-04.310), C5r (04.327-04.353), C5v (04.360-04.383), C6r (04.390-04.408), C6v (upper part of the mark of Adriaen van Berghen). Therefore, a lot of lost characters can be reconstructed. These reconstructed characters are printed between brackets '<>' in the synoptic text edition in Appendix C. I checked out that in the ultimate variants for the development of *Lanseloet* tree none of these reconstructed readings is used.

[112] As mentioned by Roemans & van Assche (1982:48), BB (1964-1979:tome III, nr. H250, pp. 483-484) gives a good bibliographical description of text A/M=05.

Text version K/K=08. According to Borchling & Claussen (1931-36,Band I:nr.488,p. 1510) this book has the same composition as text K/G=07: one duodecimo in half-sheets gathering, followed by three quarto gatherings. My visit to the Cologne library taught me that, to my astonishment, text K/K=08 did not contain four gatherings, but five. The first four gatherings each have four papers (or eight pages) and the fifth has two papers (four pages). The signatures on the K/K=08 pages differ from the boundaries of the gatherings.[113] The five gatherings are duodecimo gatherings in half sheets. The question is why the printer of text K/K=08 did not decide to let the second gathering begin with a page with the signature B1. Signature B1 is now in the middle of the second gathering. Did the printer copy the signatures of his layer text - perhaps K/G=07 - into text K/K=08?

Text version R/LO=09 has three *quarto gatherings* and one half-sheet of quarto.

Text version A/LI=10 has three *quarto gatherings* and one half-sheet of quarto as well.

Text version A/A=11. This text version consists of *two quarto gatherings*, with two text columns on each page.

Text version U/P=12. A study of this text version from 1684 shows that it consists of one gathering containing eight leaves or sixteen pages: *one octavo gathering*. I had some difficulties in determining the bibliographical format, because the horizontal direction of the chain-lines did not seem to agree with the octavo format with vertical chain-lines, as described by Gaskell (1979:figs. 50-53). Gaskell (1979:84) gives an explanation for this phenomenon: 'Turned chain-lines - that is, chain-lines in the paper that appear to run the wrong way for a particular format - are occasionally found, mostly in late-seventeenth-century and in eighteenth-century books.'

Text version U/LE=13. My study of this text version from 1708 showed that it has the same *octavo* composition as text version U/P=12, including the turned chain-lines.

Text version S/BO=14. This manuscript contains the parts spoken by Lanseloet, here called 'Lanslot', and Sandrijn. Each part or actor's role is written on *four pasted halfcut folio sheets*. Each folio sheet must have measured 33 x 41.5 cm. For more bibliographical information about this text version I refer to Hüsken & Schaars (1985:9-11).

4.3. DEMONSTRATION OF THE SOFTWARE TREATING VERSES OF *LANSELOET VAN DENEMERKEN*

In §3.4, we discussed the eight steps the software makes in order to develop type-2 variation formulas from the fourteen *Lanseloet* texts. Appendix A offers a detailed description of these steps: the first six steps concern the creation of the synoptic text; during the seventh step the *shorthand text* is created; in the eighth step the variation formulas to build the text-genealogical tree with are established. Appendix B is a guide to the interpretation of the computer output. Therefore, all the details about the computer software can be found in Appendices A and B.

---

[113] If we agree to express unprinted signatures between brackets '()' and to use '-|-' to denote the middle of a gathering, we can express the compositions of the five K/K=08 gatherings as follows. First: A1r-(A1v)-A2r-(A2v)-|-A3r-(A3v)-A4r-(A4v); second: (A5r)-(A5v)-(A6r)-(A6v)-|-B1r-(B1v)-(B2r)-(B2v); third: B3r-(B3v)-(B4r)-(B4v)-|-C1r-(C1v)-C2r-(C2v); fourth: C3r-(C3v)-(C4r)-(C4v)-|-D1r-(D1v)-D2r-(D2v); fifth: D3r-(D3v)-|-(D4r)-(D4v).

Nevertheless, the automation of the framework, finally resulting in the computer-generated variation formulas, is the focus of this thesis. It deserves attention in the main body of the dissertation as well. Therefore, we will explain how the software builds the formulas. We will focus on the last two steps, dealing with the development of the shorthand text and with the construction of the formulas. The reason we concentrate on step 7 and step 8, is that during these steps most of the text-genealogical characteristics are applied by the computer software.

To give an impression of how the software works, we use figs. 58 and 60, which demonstrate the treatment of the verses near 02.0168 and 02.0523 of the *Lanseloet* text versions. With '*verses near 02.0168*', '*verses at 02.0168*' or '*02.0168 verses*' I intend to say: 'verses in the range of 02.0168', or more precisely: 'verse 168 of base text (G/L=)02 and the accompanying verses in the synoptic edition, belonging to the thirteen other texts'. Notice that in front of a verse number one or more '0' can be present; often zeroes are left out (to save space): '06.0019', '06.019', and '06.19' are equal and all refer to verse 19 of text 06.

We start with fig. 58, which is split up in two parts on two pages. In the upper right part of the figure we see the synoptic original verses of the *Lanseloet* text versions as built during the first five steps. Each verse starts with a unique code, consisting of a *siglum*/*sigle*, denoting one of the fourteen text versions, followed by a point and ending with a verse number. In the first part of the code, the siglum part, the sigla are used as explained in §4.2 and Appendix B: '02' refers to text 'G/L', '01' represents the 'manuscript Van Hulthem', etc. Sometimes, only parts of a text version have been delivered. For example, almost all the pages of text '03' and many pages of text '04' are lost. Missing verses on such lost pages have not been numbered: their verse codes consist of the siglum, followed by an arrow '=>' followed by a star '*'.

Figure 58. Treatment by the software of (synoptic) *Lanseloet* verses 02.0168.

In the upper left corner of fig. 58, we see the verses in shorthand representation as generated by the software. As expressed before, the sixth step the software performs, the process of building a shorthand text from the original text, is described in detail in (part II of) Appendix A. Therefore, a rough sketch of it will be satisfactory at this point. In the shorthand verses, vowels composed of two or more characters are changed into vowels with one character. Some double consonant combinations are converted into single consonants. A ‘z’ in the original verses is represented by an ‘s’ in the shorthand text. Uppercase characters are changed into lowercase characters. In this shorthand simplification, different words like ‘Oock’ and ‘Ooc’ are presented in the shorthand text by the one and same word ‘ok’. Vowels consisting of more vowel characters, like diphthongs, are represented by a single shorthand vowel ‘a’, ‘e’, ‘i’, ‘o’ or ‘u’[114].

Notice that words like ‘liue’, ‘live’ and ‘lijue’ are represented in the shorthand notation by one word: ‘live’. Of course it is not claimed that shorthand words are truly existing words (which can, for instance, be found in the MNW 1885-1952). For example, words like ‘Lichaem’ and ‘lichaem’ are both simplified into ‘likham’. One could claim that both words should be represented by ‘liggam’. The point of the simplification or shorthand notation is not to give a perfect phonetic representation of the original words, yet to simplify originally word forms drastically, in such way that they can be more easily compared by the software. From that point of view, it is not important whether the word ‘Lichaem’ is rewritten as ‘likham’ or ‘liggam’.

In the middle part of fig. 58, with the header ‘Simple observations’, type-2 variant groups are presented. For example, the second observation (‘02.0168 ob02:

[114] When a ‘u’ must be interpreted as a ‘v’, it occurs as a ‘v’ in the shorthand text; analogously, a ‘v’ which must be understood as a ‘u’ is represented by a ‘u’ in the shorthand text.

01-02-05-: "ende"') tells us that the group with the texts 01, 02 and 05 has the variant 'ende'. Furthermore, it says that the variant 'ende' can be found in verse 0168 - the superfluous zero at the front may be left out for saving space in the computer memory and in the output: '168' - of base text 02. The group of the three texts is presented as '01-02-05-'. It is easy to determine how many sigla must occur in such a *true type-2 variant group*. First, a true type-2 variant group consists of two or more sigla. If it only contains one siglum, it may be part of a type-1 variation. Second, a true type-2 group may not contain all of the sigla of the delivered texts. In other words, because texts 03 and 04 have no text here, as marked by the star '*', we conclude that, in this case of the 02.0168 verses, a true variant group must contain less than twelve sigla. However, this is not accurate enough. When, again in this case, a variant occurs in eleven texts, it is likely that this variant is part of a type-1 variation. Therefore, we conclude that a true variant group in the case of 02.0168 must contain two or more sigla and ten or fewer sigla. Notice that in shorthand verse 01.211 'gratiose' occurs. This variant occurs only in text 01. Therefore, it is not mentioned in the list of type-2 groups in the box with 'Simple observations'. The word 'van' occurs in all the twelve texts. Therefore, it is not a type-2 group either.

Most of the 'Simple observations' concern the detection of type-2 groups showing certain variants. However, during the first five steps the software also observes differences in word order, the omission or addition of verses, and the concatenation of words. These observations are called 'observations at a higher level'. They are 'higher' for several reasons. First, we consider the detection of type-2 groups of variant words to be a more simple or less delicate process than, for instance, the detection of differences in word order. Second, above all, these 'higher' observations are beyond the 'normal' single word level of variants. Third, 'higher' can be understood as 'earlier', because the observations are made at a very early stage. These 'higher' observations are presented in the box with 'Simple observations' as well. The reason for this double presentation is simple. Later on, the box with the simple observations will not be displayed anymore, because the observations of the variant groups are not very interesting once they become part of type-2 variation formulas. However, the observations at a higher level are, of course, interesting and would disappear if we did not repeat them in the box with variation formulas.

The first observation ('ob01') in the box with 'Simple observations' has to do with a difference in word order. It reads:

```
02.0168 ob01: 02-06-09-10-|11-12-13-14-: W.O "si"-"is" (T2);8;
```

This computer generated line should be understood as follows. In the verses of text versions 02, 06, 09 and 10, near base verse 02.0168, the word order ('W.O') is 'si' before 'is', while the opposite word order occurs in texts 11, 12, 13 and 14. The formula concerns a type-2 variation '(T2)'), since it is built with precisely two true groups. Characteristic 8 (';8' at the end of line) deals with word order.

The lower part of fig. 58 pictures a box with variation formulas. This box features combinations of variant groups, as seen in the middle box with simple variations, which are combined into type-2 variation formulas.[115] How does the computer perform this combining process? It takes all the observations of the middle box concerning type-2 variant groups, neglecting for a moment the 'higher' observations concerning word order like 'ob01', and tries to build type-2 formulas from them. The first combination concerns the sigla of ob02 (01-02-05-, having 'ende') and ob03 (02-05-06-09-10-11-12-13-14-, having 'si'). The software sees that ob02 and ob03 have certain sigla in common, namely 02 and 05. In a good type-2 variation formula only two groups with totally different sigla occur. Therefore, the software knows that the combination of both observed variant groups in ob02 and ob03 cannot lead to a type-2 variation formula. Then, it tries the next combination: the combination of ob02 and ob04; then ob02 and ob05, ob02 and ob06, ob02 and ob07, ob02 and ob08, ob02 and ob09, ob02 and ob10, ob02 and ob11. Subsequently, it combines all the combinations of ob03 and ob04, ob03 and ob05, etc., until ob03 and ob11, ob04 and ob05, ob04 and ob06, etc. Many combinations can be rejected immediately, because both type-2 variant groups which should be part of a type-2 variation formula share one or more sigla. The interested reader, who wants to know more about the building of the formulas by the software, should read part 3 of Appendix A. (All details about the developed computer software can be found in Appendices A and B.)

The first successful combination, in which both variant groups have different sigla, is the combination of ob02 (01-02-05-, having 'ende') and ob08 (06-07-08-, having 'int'). The combination, which will lead to a formula, looks like '01-02-05-|06-07-08-="ende"|"int"'. Usually the smallest group is presented first in a combination. But the order of presentation does not matter here, since both groups have an equal amount of sigla. Notice that the sign '|' is used as a 'delimiter' to separate the two groups of sigla, and to separate the two variants.

Once a combination is successful, meaning that the sigla of both groups are different, the computer attempts to detect if the variants concerned agree with the characteristics of text-genealogical variants. It tests whether such combination of the two variant groups into a potential type-2 variation formula is in accordance with the eleven characteristics, as described in §3.3.1. When one or more characteristics is violated, the combination is rejected. The computer is ordered to mention which characteristics have been violated, which makes it possible to evaluate the eleven characteristics later on.

---

[115] As discussed in §3.2.4, the formulas are not complete, in the sense that they cover all the fourteen text versions. In §4.4.3, we will see that the computer has detected and generated 239 type-2 formulas (not preceded for instance by ^comb'). As a philologist I will check whether, for instance, the formulas are correct or can be expanded. Texts versions which are not mentioned in the formulas, are treated as if they were not delivered.

Let us take a look at the first successful combination and see how the computer judges whether it is in agreement with the characteristics of text-genealogical variants. The output line shows the formula (no. 2; the first printed formula 01 is a slightly adapted repetition of observation ‘ob01’):

```
02.0168 06 ^comb.: 01-02-05-|06-07-08-="ende"|"int" (^:W1=Co;W2=Co;
                   4a+;4b-)
```

This computer generated line shows that there are two opposite variants near base verse 02.0168, namely ‘ende’ and ‘int’, occurring in six (‘06’) texts: respectively, texts 01-02-05 and 06-07-08. The software has looked into the corpus-oriented thesaurus (see §3.2.6 and §4.1). The first word (‘W1’) ‘ende’ as well as the second word (‘W2’) ‘int’ are labelled in the thesaurus as conjunctions (‘Co’). Currently, the fact that ‘ende’ has two syllables and ‘int’ one is not observed by the computer.[116] Characteristic 4a states that text-genealogical variants must belong to the same word class. This characteristic has been fulfilled, since both ‘ende’ and ‘int’ are conjunctions (‘4a+’ or ‘4a positive’). But characteristic 4b states a.o. that variants have to be nouns or verbs. Therefore, it is violated (‘4b-’ or ‘4b negative’). Since one of the characteristics of text-genealogical variants is violated, the computer rejects the combination, which is expressed as: ‘^comb’.

The first test the computer performs, when a combination of two observed variant groups does not show conflicting sigla, is the test of characteristic 1, which states that text-genealogical variants must be at the same variation place. When this test fails, other tests of other characteristics are superfluous. In the box with formulas in fig. 58, we see that many combinations are rejected by characteristic 1. They have been numbered from a to j and placed between brackets ‘()’. In order to limit the use of paper, I generally tell the computer not to display the formulas rejected by characteristic 1. However, in the complete (electronic) Appendix D, they are offered. Without the characteristic 1 formulas, a part of fig. 58 can be presented as fig. 59.

---

[116] If the amount of syllables per verse is prescribed, the loss or addition of syllables may have had text-genealogical consequences, because copyists may have felt the urge to add or leave out words or syllables. In our *Lanseloet* case it is unlikely that the amount of syllables was prescribed for all the *Lanseloet* texts. Therefore, my software does not count the amounts of syllables per verse. In other text traditions, there may be a standard amount of syllables per verse. Then it is adviced to let the computer or philologist count the syllables, because by doing so violations of the standard syllable count (and thereby unoriginalities) can be detected.

```

```

Figure 59. Adapted repetition of a part of fig. 58.

Let us examine the other formulas. Both formulas 3 and 8 are rejected (‘^comb’), because the variants do not belong to the same word class (= characteristic 4a-). Formula 7 informs us that the difference between ‘~gratios’ (the tilde ‘~’ points to the fact that the word stands in rhyming position at the end of the verse) and ‘~gratius’ is rather small (‘<’), consisting of a difference in the vowels (‘vow.’). (I repeat that Appendix A offers a scheme to interpret the computer output). Characteristic 7b tells us that differences in vowels are text-genealogically unimportant. However, I taught the computer that I have my doubts on this matter; perhaps, differences in vowels are important after all. Because of these doubts, the software does not reject the combination immediately, but expresses the doubts in the term of question marks ‘?comb’. Formula 1 is more or less a copy of the first observation mentioned in ‘Simple observations’ box. All the ‘observations at higher level’ from this box, are presented again in the ‘Formula’ box.

The only immediately accepted combinations are formulas 4, 5 and 6, expressed by ‘comb.’, not preceded by a not-sign ‘^’ or a question mark. In other words, only these combinations have not been filtered out by the characteristics. The good combinations of the verses will be presented as potentially good variation formulas. It will be our task to investigate whether they are indeed good formulas. It is, for instance, possible that they are caused by software errors (‘bugs’) or by inefficiencies in the theoretical fundamentals. A close study of formulas 5 and 6 (see Appendix D, §5.1.2.3) teaches us that ‘gratios’ and ‘grasios’ in formula 5 only differ in their ‘t’ and ‘s’, while ‘grasios’ and ‘gratius’ in formula 6 show the same difference plus a difference in the vowels ‘o’ and ‘u’. It is quite logical that the software does not recognize these differences as text-genealogically unimportant variants. A rule like ‘differences consisting of an ‘s’ versus a ‘t’ are text-genealogically unimportant’ would have been too powerful,

because it would have incorrectly judged differences between two variants like ‘it’ and ‘is’ as trivial. However, in the case of ‘gratios’, ‘grasios’ and ‘gratius’, the differences are very small, carrying the danger of parallelism. Therefore, eventually, formulas 5 and 6 will be rejected by us as philologists; only formula 4 will pass our final philologist’s tests.

Notice that type-2 formula 4, dealing with the shorthand, variants ‘likham’ and ‘live’ would not have been detected, if the software would have worked with the original words ‘liue’, ‘live’ and ‘lijue’ on the one hand and ‘Lichaem’ and ‘lichaem’ on the other hand.

Formulas 9, 10 and 11 show us the observed type-2 variants which have not yet been captured in formulas. This is explained in detail in part 3 of Appendix A, at the end of the comments on the 02.0009 verses. However, let us discuss here as well what is expressed by formula 9:

```
02.0168 12 ^treat: 2ch.wrd "si" (Pn) in 02-05-06-09-10-11-12-13-14-
                   (rest:  01-07-08-); (^:small word?);11a?
```

The formula informs us that the small two-character word (‘2ch.wrd’) ‘si’, which is a pronoun (‘Pn’), occurring in the twelve texts near base verse 02.0168 (‘02.0168 12’), is not yet treated in a variation formula.

A variant may be considered as ‘treated’ when another competitive variant has been found with which a type-2 variation formula can be built. In three situations, both variants are considered to be ‘treated’: 1. when the formula does not start with the remark ‘^comb’ (i.e. a rejected combination); or 2. when in the formula is expressed that both variants differ only slightly (expressed by ‘<:’ or ‘?’); or 3. when both variants belong to the same word class (or one of them to the Mixed class) and are in the same variation place. The simple observations show the type-2 groups for ‘ende’, ‘si’, ‘is’, ‘live’, ‘~grasios’, ‘~gratios’, ‘int’, ‘ok’, ‘likham’ and ‘~gratius’.

Using formula 2, in which both variants belong to the same word class, we can scratch off ‘ende’ and ‘int’ as treated. With formulas 4 to 7, which do not begin with ‘^comb’, we can remove ‘live’, ‘likham’, ‘~gratios’, ‘~grasios’ and ‘~gratius’. That leaves ‘si’, ‘is’ and ‘ok’ unscratched or untreated. The fact that these three variants are left, implies that no truly competitive variants were found for them. (‘ok’, for instance, is present in formulas 3 and 8, but these are ‘^comb’ formulas.) Therefore, it is possible that these variants have been added or that other variants have vanished during the transmission of the texts. Thus, the software may have spotted added or deleted words, as covered by characteristic 11a. As we saw at the end of §3.3.1, this characteristic warns us that the interpolation or deletion of small words can be parallelistic and thus text-genealogically unimportant. But what is a *small word*? Rather arbitrarily, I decided that a small word has three or fewer (shorthand) characters. When the software meets such a small untreated variant, it knows that this variant does not have text-genealogical significance. In that case, it says ‘(^:small word?);11a?’,

which implies a rejection of the variant, although the question marks express some doubts. Later on, we will evaluate characteristic 11a.

Now, let us turn to another example to demonstrate how the software works. We review the output of the 02.0523 verses, pictured in fig. 60. Again we see in the upper right corner the original verses and in the upper left corner the verses in shorthand. The middle box features the simple observations, and in the lower box the variation formulas are presented. We will discuss the first four observations (‘spli’, ‘ob01’, ‘ob02’ and ‘ob03’) and the accompanying first four formula lines on p. 131. Notice that a word like ‘haten’ does not occur in the list of observations. It occurs only in one text, text 9, and, therefore, does not belong to a type-2 group. Additionally, we see that the formulas that violate characteristic 1 - requiring that text-genealogical variants should stand at the same variation place - have been left out. In other words, the combinations ob05+ob09, ob07+ob08, ob08+ob10, ob09+ob10 and ob09+ob11 have not been mentioned, because the variants violate the first characteristic. The formulas are not numbered anymore. The numbering in the previous example only served explanatory purposes.

```

Figure 60. Treatment by the software of (synoptic) *Lanseloet* verses 02.0523.

We see that ob04 (with the shorthand word ‘of’ in texts 02-06-07-08-) and ob10 (with ‘oft’ in 09-11-12-13-14-) have been combined into a formula:

```
02.0523 09 ^comb.: 02-06-07-08-|09-11-12-13-14-="of"|"oft"
                   (<:fin.t;7a;6a)(^:W1=Mx; W2=Co;4b-)
```

The formula is rejected, as expressed by ‘^comb’, for several reasons. First, ‘<:fin.t;7a;6a’ expresses that characteristic 7a, concerning inflection, and/or characteristic 6a, concerning orthographical differences, has been violated. The difference between both variants is a final consonant ‘t’. Of course, we know that words like ‘of’ or ‘oft’ do not have inflections. The software expresses with ‘7a;6a’ that characteristic 7a and/or (in this case: or) 6a has been violated. Second, the software has detected that both variants are not substantives or verbs, which means that characteristic 4b is violated: ‘^:W1=Mx;W2=Co;4b-’. The first word in the formula, W1, is ‘of’; W2 is ‘oft’. In the thesaurus ‘oft’ belongs to the word class Conjunctions. ‘Of’ is not only a conjunction; it can also be an adverb or a part of a verb, as in the verse 06.507 ‘Vre ghetrouwe ind neit of gaen’. Because it can be an adverb or a conjunction, or more precisely, because it belongs to several non-verb or non-noun word classes, the word ‘of’ is classified under the Mixed word category.

The combination of ob04 (with ‘of’ in 02-06-07-08-) and ob11 (‘ok’ in 09-11-12-13-) into a formula is rejected because characteristic 4b is violated. The same is true for ob05 (‘te’ in 01-02-05-09-11-12-13-14-) and ob08 (‘tso’ in 06-07-08-). The combination of ob07 (‘~laten’, with the tilde ‘~’ to denote the rhyming position of the shorthand word, in 01-02-05-11-12-13-14-) and ob09 (‘~lassen’ in 07-08-) is rejected for a special reason. The computer was taught that texts 06, 07 and 08 are German or German-like texts. When variants in a set of German texts are in opposition with variants in Dutch-like texts, several extra rules in the software are applied, to avoid that variants caused by the differences between the languages/dialects slip through as good variants. In this case, the software has detected that the difference between the German ‘lassen’ and the Dutch ‘laten’ is rather small; the difference - the German texts have a couple of ‘s’, where the Dutch texts have a ‘t’ - is considered to be small and falls under characteristic 7c: ‘<:GD (t)s|t;7c’. ‘GD’ stands for ‘(small) German-Dutch

difference'. The formula expresses also that both words are in rhyming position, ruled by characteristic 5: 'wds r.p;5'. The combination of ob08 ('tso' in 06-07-08-) and ob11 ('ok' in 09-11-12-13-) is rejected, because these words belong to different word categories, as expressed by characteristic 4a.

The final formula is a 'not treated' formula:

```
02.0523 11 ^treat: 2ch.wrd "om" (Mx) in 02-05-06-07-09-11-12-13-14-
                   (rest: 01-08-) (T3 or T2?); (^:small word?);11a?
```

All type-2 variant groups mentioned in the box with simple observations have been covered in formulas in the middle box, except for the variant group of 'om'. This small word, consisting of two characters, belongs to the mixed word category, since it can be an adverb or a preposition. It occurs in nine text versions 02-05-06-07-09-11-12-13-14-, while it is not present in texts 01 and 08. The verses of texts 03 and 04 have not been delivered, as denoted by '*', while text 10 shows a hole or absent verse, compared with base verse 02.0523. The group 01-08-, without 'om', consists of two members. This implies, as the software knows, that two possible formulas can be shaped:

```
01-08-|02-05-06-07-09-11-12-13-14-: '-hole?-'|'om'
```

which is a type-2 formula, or:

```
01-|08-|02-05-06-07-09-11-12-13-14-: '-variant.x-'|'-variant.y-|'om'
```

which is a type-3 formula. Both possibilities are expressed by the element '(T3 or T2?)' in the formula. In this case, we can create a type-3 formula:

```
01-|08-|02-05-06-07-09-11-12-13-14-: 'omme'|'umb'|'om'
```

The subject of the previous sentence is 'we', because the software is ordered to deal with type-2 groups and does not take into consideration one member groups like 01- with 'omme' and 08- with 'umb'.

Now we will discuss the first four observations and the formulas in fig. 60.

The first observation, mentioned in the box with the header 'Simple observations' concerns the shorthand word 'darumb' in text 08 and the word 'darom' in texts 09-11-12-13. The software tells us that it has split this word into 'dar umb' in text 08 and 'dar om' in the other four shorthand texts. When dealing with old written or printed texts in Dutch dialects, we are often confronted with different orthographical systems. More or less the same words can be written in considerably different ways. By simplifying the original words into shorthand words, we can prevent the software from mistaking them for competitive variants. Yet, we

must find a solution for another orthographical problem, which I call *the problem with the word boundaries*. It is possible that one copyist writes two or more words (for example ‘dar’ ‘om’), while another copyist writes them as one clustered word (for example ‘darom’). Of course this phenomenon hampers the automated detection of competitive variants. (Related to the problem of word boundaries is *enclisis*, the phenomenon that two or more words or word parts are combined or clustered into smaller words or word parts. Fortunately, enclisis does not occur in our corpus of *Lanseloet* variants; it is not necessary to teach the computer to recognize and treat enclisis.)

I found a pragmatic solution for the problem with the word boundaries. I taught the computer to split a word into two or more compartments, when this word shows these separated compartments in the same verse of another text version. In other words, the appearance of certain words in a verse in one or more texts dictates whether a word in a verse of another text version should be divided. In the case of the 02.0523 verses, we see that verses 01.0552, 02.0532, 07.0531 and 14.0333 have two words ‘dar om’. Now, because texts 01-02-07-14- show the two separate words ‘dar’ and ‘om’ (or, more precisely: the word ‘dar’ and a word starting with a vowel followed by a ‘m’), ‘darom’ (or the variant ‘darumb’) in the other texts must be divided. We do not claim that splitting up the word ‘darom’ in the 02.0523 verses implies that all the occurrences of ‘darom’ in all the verses of all the text versions must be split up. The division is limited to the 02.0523 verses. In other verses - like, for instance, near 02.0603 -, ‘darom’ remains one word, unless accompanying verses of other texts make a division necessary.

The first observation, in the middle box of fig. 60, reads:

```
02.0523 spli: *darumb* (in 08-) in t. 08-09-11-12-13- --> *dar umb*
              (in 08-), based on t. 01-02-07-14-;6b
```

This must be understood as: ‘in the shorthand verses near base text verse 02.0523 the word ‘darumb’, as occurring in text 08 (it occurs, possibly in variant forms, in texts 08-09-11-12-13-), has been split up in the two words ‘dar’ and ‘umb’, because in texts 08-09-11-12-13- this word is split up as such’.

The second observation displayed in the middle box is:

```
02.0523 ob01: 12-13-14-|01-02-05-06-07-08-09-11-: TWO or more rules
              (T2?);11b; philologist...
```

which has been slightly adapted in the lower box as follows:

```
02.0523 11 ?obs01: 12-13-14-|01-02-05-06-07-08-09-11-: TWO or more
                   rules (T2);11b; philologist...
```

The third observation is:

```
02.0523 ob02: 10-|01-02-05-06-07-08-09-11-12-13-14-: 10- has NO TEXT
              (T1?);11b
```

This observation is displayed in the lower box with formulas as:

```
02.0523 12 ^obs02: 10-|01-02-05-06-07-08-09-11-12-13-14-: 10- has NO
                   TEXT (T1);11b
```

The observation concerns the automated *detection of the loss of a verses*. While executing the first five steps in which the synoptic text is built, the software detected that a verse is missing in text 10. The difference between 'missing' or 'added' verses is not important for the process of building a chain. When I use the word 'missing', I mean 'missing in comparison with base text 02'. The relative absence of a verse is denoted by the absent-sign '@'. Notice that the other absent-sign '*', as used for text 03, has a different value. '@' refers to an observable absence in a text, while '*' expresses that lines of text have been lost due to the ravages of time. In other words, the '*' refers to a non-observable lack of text.

The fourth observation '02.0523 ob03: 09-|01-02-05-10-11-12-13-14-: rhyming pair (~haten - ~laten) of text 02 (near 02.0522) is inverted in text 09 (T1);10', can also be found in the formula box (with '09 ^obs03:' instead of 'ob03'). In fig. 81, we present 02.0522 verses.

Both examples concerning the 02.0168 and 02.0523 verses demonstrated how the software builds variation formulas. The software has developed thousands of variation formulas. These are presented in Appendix D (on the cd-rom), in the order of the occurrence of the eleven text-genealogical characteristics. In Appendix C (like all the appendices on the cd-rom as well) we present the synoptic texts plus the variation formulas. Notice that in Appendix C the middle boxes with 'Simple observations' have been left out. Many figures (see the 'List of Pictured *Lanseloet* Verses', on p. 348) in this book display the Appendix C output, which allows readers who do not possess a cd-rom-player to get a good impression of the computer output.

4.4. First Computer Results: All the Detected Text-Genealogical *Lanseloet van Denemerken* Variants

4.4.1. Introduction: +Comb-formulas and Obs-formulas

The computer has compared the verses of the fourteen *Lanseloet van Denemerken* versions and has produced many variation formulas, presented in Appendix D. The question is how we can use these formulas for our ultimate goal, the development of the *Lanseloet van Denemerken* tree.

We distinguish three types of formulas:

1. *'^comb'-formulas* or *negative combination formulas* with the element '^comb' in them. These formulas are rejected by the computer because they violate one or more text-genealogical characteristics. We will not use them for the development of the genealogical tree(s) of *Lanseloet van Denemerken.*
2. *'Obs'-formulas* or *observatory formulas*, with the element '?obs' in them. In these formulas, observations beyond single word level are expressed, concerning, for instance, missing or added verses.
3. *'+Comb'-formulas*, with the element 'comb' not preceded by a ^-sign.

In the following sections, we will focus on the 'Obs' and '+Comb' formulas and investigate which formulas are useful for our goal.

4.4.2. THE OBS-FORMULAS

Characteristics 1 to 7 deal with differences between word variants, expressed in 'Comb' formulas. The subject of this section is the variants and variation formulas concerning characteristics 8 to 11, which we use for the development of a trustworthy tree. The formulas are computer generated observations beyond the single word level and must be partly checked by the philologist.

Characteristic 8 deals with differences in word order (see chapter 8 of Appendix D). As explained in §3.2.5, we have doubts about its text-genealogical power. Therefore, we will not use it for the development of the tree. In §5.3.8, we will evaluate the text-genealogical value of differences in word order.

Characteristic 9a cannot provide us with concrete variants and variation formulas we are looking for, since this characteristic is negative. It is negative in the sense that it only informs us that a rhyming word in a verse violates the rhyme scheme. On p. 99, we saw that characteristic 9a states that text-genealogical variants in rhyming position have to obey rhyming conventions. If they violate these conventions, the variants cannot be used for building trees with. In other words, characteristic 9a is unsuitable for finding text-genealogical variants. It can only forbid certain variants to be used as variants to build trees with.

Characteristic 9b concerns a special type of violation of rhyming conventions: two rhyming verses having the same rhyming words. Most often such a violation cannot be easily repaired, by which it can serve our tree-building goals. All the useful characteristic 9b observations are presented at the end of §9.2.2 of Appendix D: 'Duplicate Rhyming Words in a Type-2 Environment':

```
02.0212 11  obs01: 07-08-|02-04-05-06-09-10-11-12-13-: 2 duplicate
                   (= 1 incorrect) rhyming words;T2;9b
02.0680 10  obs01: 02-04-06-07-08-|09-10-11-12-13-: 2 duplicate (=
                   1 incorrect) rhyming words;T2;9b
02.0740 11  obs03: 04-05-|02-06-07-08-09-10-11-12-13-: 2 duplicate
                   (= 1 incorrect) rhyming words;T2;9b
```

Figure 61. *Lanseloet* variation formulas concerning characteristic 9b ('duplicate rhyming words').

Characteristic 10 observations deal with inverted verses. The only useful observation is printed in §10.1 of Appendix D, 'Inversion of verses: Type-2 Variation Formulas' (see also fig. 54 with the 02.0746 en 02.0747 verses):

```
02.0746 12  obs01: 09-10-11-12-13-|01-02-04-05-06-07-08-: rhyming
                   pair (~sandrin - ~guldin) of text 02 (near
                   02.746) is inverted in texts 09-10-12-12-13-
                   (T2);10
```

Figure 62. *Lanseloet* variation formulas concerning characteristic 10 ('inverted verses').

Characteristic 11 observations deal with omitted and added words or verses. Useful characteristic 11 observations are presented in Appendix D §11.2.1.1, ''Empty' Verses in Type-2 Environment: Judgement Philologist Needed':

```
02.0039 13  obs01: 09-11-12-13-14-|01-02-04-05-06-07-08-10-: first
                   group (T2) have NO TEXT;11b;
02.0127 12  obs01: 09-11-12-13-14-|01-02-05-06-07-08-10-: first
                   group (T2) have NO TEXT;11b;
02.0208 13  obs01: 12-13-14-|01-02-04-05-06-07-08-09-10-11-: first
                   group (T2) have NO TEXT;11b;
02.0264 13  obs01: 07-08-|01-02-04-05-06-09-10-11-12-13-14-: first
                   group (T2) have NO TEXT;11b;
02.0678 12  obs01: 12-13-|01-02-04-05-06-07-08-09-10-11-: first
                   group (T2) have NO TEXT;11b;
02.0817 11  obs01: 12-13-|01-02-05-06-07-08-09-10-11-: first group
                   (T2) have NO TEXT;11b;
```

Figure 63. *Lanseloet* variation formulas concerning characteristic 11b ('omitted/added verses').

They are also present at the end of Appendix D, §11.2.2.1, entitled ''Extra' Verses in T2 Environment: Judgement Philologist Needed':

```
02.0082 12  obs01: 11-12-13-14-|01-02-05-06-07-08-09-10-: TWO or
                   more rules (T2);11b;
02.0523 11  obs01: 12-13-14-|01-02-05-06-07-08-09-11-: TWO or more
                   rules (T2);11b;
02.0999 11  obs01: 11-12-13-|02-04-05-06-07-08-09-10-: TWO or more
                   rules (T2);11b;
```

Figure 64. *Lanseloet* variation formulas concerning characteristic 11b ('missing/added verses').

4.4.3. THE +COMB-FORMULAS CONCERNING CHARACTERISTICS 5 AND 7D AND THE +COMB-FORMULAS NOT REJECTED BY ANY CHARACTERISTIC

The comb-formulas that were not rejected by characteristics 1 to 7 can be found in three sections in Appendix D. In the first place, in §5.1.1, 'Characteristic 5: Clear Informative Cases':

```
02.0085 09  comb.: 02-06-07-08-|05-09-12-13-14-="~din"|"~viloni"
                   (wds r.p;5)
02.0104 12  comb.: 07-08-|01-02-05-06-09-10-11-12-13-14-="~gesgit"|
                   "~gesit" (wds r.p;5)
02.0175 11  comb.: 11-12-13-|01-02-05-06-07-08-09-10-="~lit"|"
                   ~besit" (wds r.p;5)
02.0385 12  comb.: 09-11-12-13-|01-02-03-05-06-07-08-10-="~sot"|
                   "~spot" (wds r.p;5)
02.0868 11  comb.: 11-12-13-14-|01-02-05-06-07-08-10-="~viant"|
                   "~wigant" (wds r.p;5)
02.0943 12  comb.: 11-12-13-|01-02-04-05-06-07-08-09-10-="~viant"|
                   "~wigant" (wds r.p;5)
02.0991 12  comb.: 07-08-|01-02-04-05-06-09-10-11-12-13-="~van"|
                   "~an" (wds r.p;5)
02.0992 12  comb.: 12-13-|01-02-04-05-06-07-08-09-10-11-="~wint"|
                   "~mint" (wds r.p;5)
02.1004 09  comb.: 02-06-|04-05-09-10-11-12-13-="~gliden"|"~liden"
                   (wds r.p;5)
```

Figure 65. *Lanseloet* variation formulas concerning characteristic 5 (‘words in rhyming position’).

In the second place, in §7.4.1.1, ‘Different Names With Potential Text-Genealogical Power’:

```
02.1006 10  comb.: 09-11-12-13-|02-05-06-07-08-10-="isum"|"maria"
                   (diff. names with < prox. 0.22;7d)
```

Figure 66. *Lanseloet* variation formulas concerning characteristic 7d (‘different names’).

The 02.1006 verses are presented in fig. 67:

```
02.1006 ende bidden maria di maget fin      < 02.1006 Ende bidden maria die maghet fijn [920]
01*                                         < 01=>*
05.1016 ende bidden maria der maget fin     < 05.1016 Ende bidden maria der maghet fijn
06.1018 int bidde maria der maget fin       < 06.1018 Ind bidde maria der maghet fijn
07.1017 int bidde maria di maget fin        < 07.1017 Ind bidde maria die maghet fyn
08.1014 int bidde maria di maget fin        < 08.1014 Ind bidde maria die maget fyn
09.1013 ende bidden isum gristum fin        < 09.1013 Ende bidden Iesum Christum fijn/
10.1021 ende bidden maria di maget fin      < 10.1021 Ende bidden Maria die maghet fijn
11.1028 ende bidden isum gristum fin        < 11.1028 Ende bidden Iesum Christum fijn
12.1022 ende bidden isum gristum fin        < 12.1022 Ende bidden Iesum Christum fijn/
13.1022 ende bidden isum gristum fin        < 13.1022 Ende bidden Iesum Christum fijn/
03*                                         < 03=>*
04.402  ende bidden mariam der maget fin    < 04.402  Ende bidden mariam der maghet fijn
14*                                         < 14=>*
```

```
02.1006 11 ^comb.: 06-07-08-|02-04-05-09-10-11-12-13-="int"|"ende" (^:W1=Co;W2=Co;4a+;4b-)
02.1006 11 ^comb.: 06-07-08-|02-04-05-09-10-11-12-13-="bidde"|"bidden" (<:fin-n;7a)
02.1006 10  comb.: 09-11-12-13-|02-05-06-07-08-10-="isum"|"maria" (diff. names with < prox.
(+)                0.22;7d)

Figure 68. 239 *Lanseloet* variation formulas, not rejected by any characteristic.

4.5. The Removal of Incorrect *Lanseloet van Denemerken* Variants by the Philologist, Applying Non-Automated Characteristics

The 239 completely computer-generated variation formulas presented in fig. 68, seem to agree with all the characteristics of text-genealogical variants. In fact, 239 is a relatively small amount, considering that the software developed and tested ten thousands of potential variation formulas. Furthermore, characteristics 1 and 2, which will be evaluated in §5.3.1 and §5.3.2, have proved to be mighty filters; ‘only’ 5758 variation formulas do not violate these characteristics (see Part III of

Appendix B). Of these 5758 interesting formulas only 239 are not rejected by any other characteristic. Having these remaining 239 formulas, we can say that the automatized characteristics have filtered out more than 96 percents of the potential variation formulas (that did not violate characteristic 1 or 2). In other words, in applying the text-genealogical characteristics the computer has saved the philologist a lot of work, which previously had to be performed by hand. Additionally, we know that the computer applied the characteristics in a consequent way.

Although the characteristics filtering capacities are impressive, we should consider that some characteristics may be leaky, in the sense that they do not act in a correct way. Perhaps some automated characteristics accept variants, while this was not our intention. This may be due to errors or imperfections in the software. Therefore, we must have a critical look at the 239 formulas.

This examination, described in §12.2 of Appendix D in detail, teaches us that we can use 33 formulas; 206 of the 239 formulas must be filtered out by hand (although most of them are not in conflict with the ultimate stemma!):

1. 59 German/Dutch cases (all mentioned in Appendix D, §12.2.1):

   According to characteristic 7c, a variant cannot be a word that uniquely belongs to one specific dialect or language and that is unknown in other dialects or languages. Texts 06, 07 and 08 were printed in Cologne. These texts show unique ‘German(-like)’ words, which do not occur in the other texts. Characteristic 7c forbids us to use them as text-genealogically informative variants. In the future, we can easily teach the computer to recognize these specific non-informative German words.

   Three examples of the 59 German/Dutch cases, which must be filtered out by hand:[117]

[117] Possibly, it comes as a surprise that the (shorthand words) ‘lifde’ and ‘minne’ fall under German/Dutch cases. This is explained in Appendix D, §12.2.1.1. Generally, the German texts prefer to speak about ‘liefde’ instead of ‘minne’ (both meaning ‘love’), most likely because ‘minne’ developed an unsuitable sexual connotation in the fifteenth century. This is confirmed by Ballard (1995:275). Almost everywhere in the three Cologne texts the ‘Dutch’ word ‘minne’ has been replaced by ‘liefde’. However, when the word ‘minne’ or a derived word is standing in rhyming position (at, for instance, verses 02.0575, 02.0614, 02.0778, 02.0789, etc.) it has a strong position, even in the Cologne texts. In rhyming position the word ‘minne’ was not replaced by ‘liefde’, because otherwise the rhyme scheme would have been broken. Nevertheless, near base verse 02.0666, the *Lanseloet* texts 01-02-05-09-10-11-12-13- have the noun ‘minnen’ in rhyming position. This word is assonatingly rhyming with ‘(ge)vinden’ or ‘(ge)winnen’ of the next verse (in texts 01-02-05-06-07-08-09-10-11-12-13-. The German texts 06-07-08- have ‘lifden’, logically not rhyming with ‘vinden’. A German couple like ‘lifden’-‘vinden’ clearly indicates the Dutch source (‘minnen’-‘vinden’) of the German texts. We conclude that it is likely that there was a ‘German’ tendency to replace ‘minne’. This conclusion is confirmed by Ballard (1995:274-276). Therefore, a clear danger of parallelism exists. We will not use the variation formulas in which the German texts have ‘minne’ and the other texts ‘lifde’ (etc.). The same is true for the replacement of the ‘Dutch’ verb ‘minnen’ by ‘lief hain’.

```
02.0013 12  comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-="lifde"|
                   "minne"
02.0026 12  comb.: 06-07-|01-02-04-05-09-10-11-12-13-14-="wisse"|
                    "wet"
02.0193 05  comb.: 07-08-|01-05-06-="junfrawen"|"jonkfrawen"
```

2. 21 combinations of characteristics 6 and/or 7 (all mentioned in Appendix D, §12.2.2):

   Until now, the software was able to detect characteristics 6 (small accidental differences, like 6a: orthographical differences) and 7 (other potential parallelisms, like 7a: differences in inflection or suffixes/affixes or 7b: differences in vowels) separately. I simply forgot to program the computer to reject combinations of these characteristics. The detection of combinations of characteristics can be programmed quite easily in the future. One example of such a combination is:

   ```
   02.0262 09  comb.: 07-08-|04-05-10-11-12-13-14-="sente"|"sint"
   ```

   The software is able to judge the difference between ‘sente’ and ‘sent’ (being a final-e, ruled out by characteristic 7a), and the difference between ‘sent’ and ‘sint’ (being a difference in vowels, ruled out by characteristic 7b). At this point, the software does not recognize that the difference between ‘sente’ and ‘sint’ falls under both characteristic 7a and 7b, and is, therefore, an ungenealogical difference, which cannot be used for the development of a tree.

3. 46 Variants, not occurring in the thesaurus with text-genealogically uninformative word categories (all mentioned in Appendix B, §III.a.4, and in Appendix D, §12.2.3):

   When potential variation formulas are built with variants belonging to text-genealogically uninformative word categories like adverbs, adjectives, auxiliaries or frequently used verbs, (personal) pronouns, etc., these variation formulas are rejected by the software, since we are only interested in substantives and verbs as text-genealogically informative variants. The text-genealogically unimportant word categories contain limited sets of words, which are described in chapter 4 of appendix D. After running the software, I realized that some words had to be added to the ungenealogical word categories of the thesaurus.[118] If shorthand words like ‘altemal’, ‘dorperlik’, ‘geris’, ‘gise’, (the adjective) ‘got’, (the adjective) ‘gode’, ‘harde’, ‘hastelik’, ‘hastilik’, ‘laken’, ‘ligtelik’, ‘like’, ‘(ten) minste’,

[118] A reviewer remarked that these words, which may be added to the thesaurus, are closely related to the corpus of *Lanseloet van Denemerken* texts. This observation is correct. In §4.1, I explained that my software is corpus-oriented. Of course, if a parser would have been available, it would not have been necessary to make (and adapt) the thesaurus.

‘mogen’, ‘moten’, ‘omme’, ‘onser’, ‘samen’, ‘salt’, ‘selven’, ‘sidi’, ‘sint’, ‘tfi’, ‘twe’, ‘ungelont’, ‘uter’, ‘utter’, ‘war’, ‘wawdet’, ‘weg’, ‘werwarts’, ‘werwert’ would have been part of the unimportant categories, 46 formulas would have been rejected automatically. One of the 46 formulas to be disregarded is:

```
02.0040 12  comb.: 04-05-|02-06-07-08-09-10-11-12-13-14-="altemal
                   "|"mal"
```

4. 8 Verb-variants versus Noun-variants (all mentioned in Appendix D, §12.2.4):
   In some formulas a substantive variant stands across from a verbal variant. Currently the thesaurus does not contain substantives and verbs. If it would have contained these categories, these formulas would have been rejected because the variants belong to different word categories (= characteristic 4b). One example is:

```
02.0746 09  comb.: 01-02-04-05-|09-10-11-12-13-="spreken"|
                   "penningen"
```

5. 5 Different variation places (all mentioned in Appendix D, §12.2.5):
   The detection of whether variants are at the same variation place depends on the position of variants in the verses. Their left and right position in a rule are compared, without considering the direct neighbours of the variants (see also §5.3.1). The detection of the (same) variation places only works optimally when the verses have more or less the same words in the same positions. Fortunately, the verses of the *Lanseloet* texts are very similar. Sometimes, however, the verses differ considerably, for instance because they have a different word order or when complete verses are inverted. Then, the observation of the variation places is not optimal. These observations would have been better if the position of the neighbours of variants had been taken into account as well. Then, some formulas would not have occurred, like, for example:

```
02.0545 09  comb.: 12-13-|02-05-06-07-09-10-11-="gan"|"lit"
```

6. 20 Small differences between variants, not treated by the software yet (all mentioned in see Appendix D, §12.2.6):
   Some variation formulas concern variants that differ slightly. Slight, accidental or parallelistic, differences are not treated by the software yet, for example:

```
02.0321 09  comb.: 02-05-|06-07-09-10-11-12-13-="vrinsgap"|
                   "vrintsgap"
```

7. 47 Special cases (all mentioned in Appendix D, §12.2.7):
   One example of these special cases is:

```
02.0045 12  comb.: 01-05-|02-06-07-08-09-10-11-12-13-14-="dleven"
                   |"leven"
```

In §12.2.1 to §12.2.7 of Appendix D we describe which variation formulas have been filtered out and on which grounds. This reduces the number op 239 variation formulas into 33 formulas. In §12.2.8 of the Appendix it is shown that some of these 33 formulas can be combined. For example, two (of these 33) formulas

```
02.0313 09  comb.: 12-13-|02-04-05-08-09-10-11-="vange"|"brenge"
02.0313 04  comb.: 06-07-|12-13-="bringe"|"vange"
```

can be combined into one formula:

```
02.0313 11  comb.: 12-13-|02-04-05-96-07-08-09-10-11-= "vange"|
                   "brenge"/"bringe"
```

This non-automated process reduces the 239 variation formulas in fig. 68 to the following 21 good variation formulas, presented in §12.2.8 of Appendix D.

```
02.0085 11  comb.: 02-06-07-08-|05-09-10-11-12-13-14-="dorper minne"|

Figure 69. The remainder: 21 *Lanseloet* variation formulas.

4.6. PRESENTATION OF THE VARIATION FORMULAS FOR BUILDING THE *LANSELOET VAN DENEMERKEN* CHAIN

The 45 text-genealogical formulas from figs. 61 (characteristic 9b), 62 (characteristic 10), 63 (characteristic 11b), 64 (characteristic 11b), 65 (characteristic 5), 66 (characteristic 7d) and 69 are presented in fig. 70. The second text-genealogical principle, presented in §3.2.2, orders us to present the apparatus of variants as completely as possible, in order to create the opportunity for everyone to falsify or criticize it.

It is likely that texts 01, 02, 05, 08, 09 and 10 are not inter-
mediate nodes, as shown by the following Appendix D sections: §10.2
(inversion of verses in type-1 environment), §11.2.1.2 (empty verses
in T1 environment) and §11.2.2.2 (extra verses in T1 environment)
```

Figure 70. The result (of figs. 61, 62, 63, 64, 65, 66 and 69): 45 variation formulas.

It is possible to start developing the *Lanseloet van Denemerken* tree with the 45 formulas of fig. 70. However, in the variation formulas in fig. 70 shorthand variants are presented. If these shorthand variants are replaced by the original non-shorthand variants, the variation formulas become even more understandable.

In fig. 71 the same variation formulas as in fig. 70 are presented, but now with the original non-shorthand variants and with the addition of some comments between brackets '()'. The comments consist of three parts, not necessarily all present for each formula: 'a.', 'b.' and 'c.'. The comments after 'a.' refer to the

texts in the first group of the formula, and the ones after ‘b.’ to the second group. After ‘c.’, we find comments which refer to texts not present in the formula. As stated in fig. 57, only fragments, of texts 03, 04 and 14 are delivered. In the c-comments below, ‘03=nd’, ‘04=nd’ and ‘14=nd’ are used to express that the specific verses of texts 03, 04 and 14 are not delivered. ‘03+04=nd’ means that the verses of 03 and 04 are non-delivered and, therefore, unknown to us.

Figure 71. 45 *Lanseloet* variation formulas, including the original (non-shorthand) variants. (Remark: in fig. 84, an Appendix, formulas 46 to 54, will be presented.)

4.7. The Development and Presentation of the *Lanseloet van Denemerken* Chain with Use of Cladistics

4.7.1. First Attempt to Build the *Lanseloet van Denemerken* Chain; a Handmade Sketch of this Tree

Now that we have our 45 variation formulas, we could let the cladistic software program PAUP build a tree from them. However, we will postpone that step for a while. The main reason to do so is that PAUP is able to build one or more trees from almost any set of variation formulas presented to it. Therefore, it is good to have our own ideas about of the shape of the tree(s) beforehand. We can use the algorithm in fig. 12, §2.4.4, for our sketch of the tree(s).

A reader of an earlier version of this book wondered why I did not decide to let PAUP alone treat our 45 formulas. He feared that I would become (unscientifically) prejudiced, having built my own *Lanseloet* tree with the algorithm first. Allow me to respond to this remark. First, the algorithm consists of clear rules, which cannot be manipulated. Admittedly, the set of rules may be less impressive or sophisticated than PAUP's rules for drawing chains. One deviating formula or variant can call a stop to the work of the algorithm. But if the algorithm can be carried out, the tree it produces is good and trustworthy. There is no reason to think that such a tree has a lesser value, because it has been developed with a simple set of rules and not by sophisticated software. Second, when I build a chain with the algorithm, I know what I am doing. Small clusters of texts are simply combined into larger clusters and, finally, into a chain. I did not develop PAUP. I am only using it. Therefore, I do not precisely know how it build its trees. I have worked for about twenty years with computers and software programs. Too often, I have seen them produce incorrect results due to software

errors. Therefore, I mistrust computer results a bit. I want to have an idea or a rough impression of the end result before I set the computer to work. Third, the approach of developing a tree with our algorithm and with PAUP, may enable us to check the algorithm. To resume, I do not believe that the double procedure I used leaves much room for prejudice. On the contrary, if we have two *Lanseloet* chains at hand, built in two separate ways, we can compare them and learn from their differences. If both chains are the same, they become even more acceptable or plausible.

In the formulas in fig. 71, we see several *temporary end groups*, the building stones of a chain (as discussed in §4.2.2).[119] These end groups 'a' to 'n', extracted from the variation formulas, are pictured in fig. 72.

a. 09-10-11-12-13-14-	: formula 24
b. 09-11-12-13-14-	: formulas 01 and 07
c. 11-12-13-14-	: formula 02
d. 12-13-14-	: formula 22
e. 01-02-06-07-08-	: formula 23 and 39
f. 01-02-	: formula 16
g. 06-07-08-	: formula 17
h. 07-08-	: formula 11
i. 03- ?????	: There is not enough information available about text 03: only formula 18 informs us that it must be located in the area of texts 01, 02, 05, 06, 07, 08 and 10
j. 04-05-09-10-11-12-13-(14-)	: formula 39 and 02 (combined)
k. 01-02-04-05-06-07-08-	: formula 30
l. 04-05-06-07-08-09-10-11-12-13-14-	: formulas 16 and 28 (combined)
m. 01-02-04-05-06-07-08-10-	: formula 01
n. 04-05-	: formulas 29 and 37

Figure 72. Fourteen *Lanseloet* end groups a to n.

Having these formulas and end groups, it should be possible to sketch with the algorithm of fig. 12 the chain of *Lanseloet van Denemerken* text versions. Notice that in the case of the fourteen *Lanseloet* texts the algorithm will only use end groups with seven or fewer members for the development of the chain: 01-02-, 04-05-, 07-08-, 06-07-08-, 12-13-14-, 11-12-13-14-, 01-02-06-07-08-, 09-11-12-13-14-, 09-10-11-12-13-14-, 01-02-04-05-06-07-08-. A larger end group, like end group k, 01-02-04-05-06-07-08-, will not be used for drawing the chain. Of course, end group k must be found or must fit in the developed chain.

[119] The word 'temporary' is used, with some caution, because none of the variation formulas presented apply to all the fourteen texts.

Fig. 73 illustrates the several steps of the algorithm. It demonstrates the growth process from smaller groups to larger groups to the chain of *Lanseloet van Denemerken*, pictured in the 'End'-box. Notice that text 03 is not part of the chain, due to a lack of observations concerning this text.

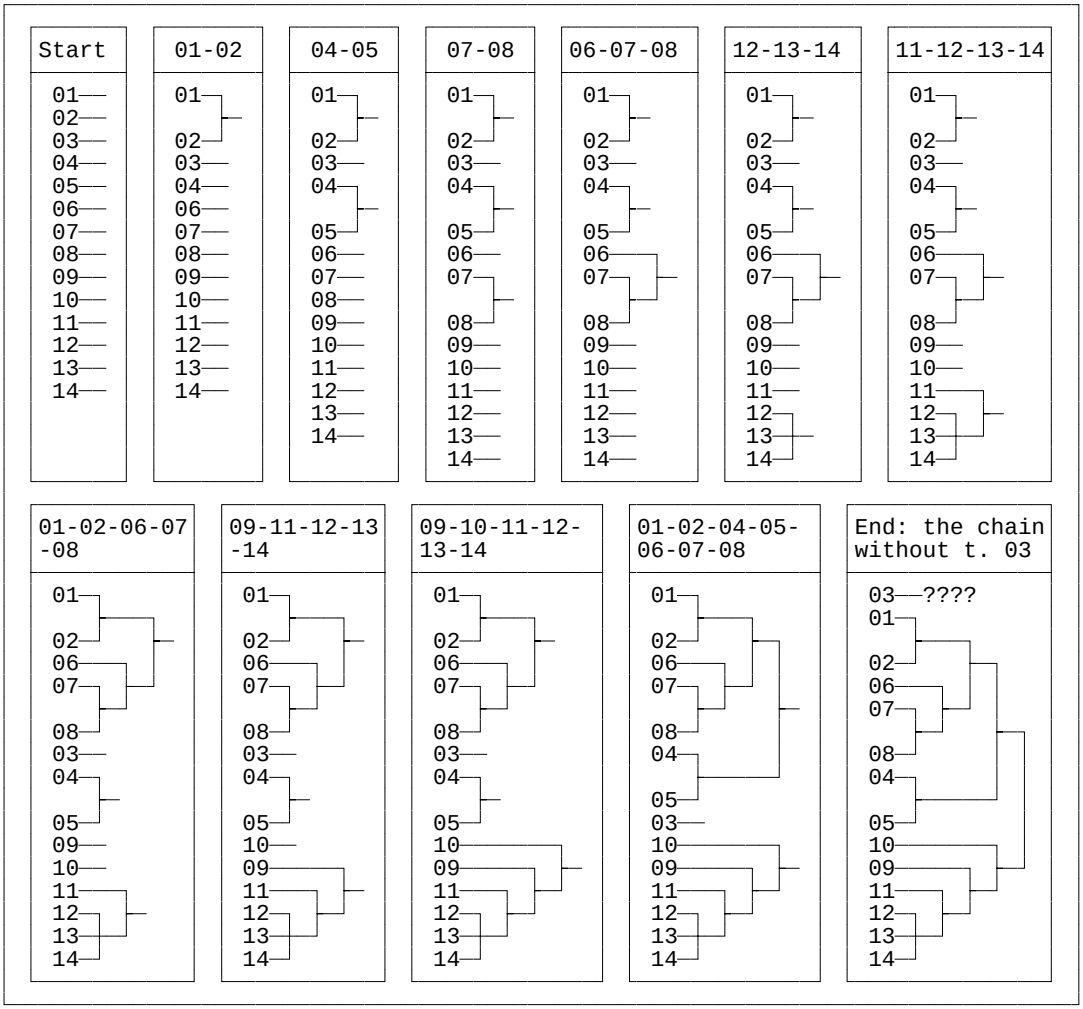

Figure 73. Application of the algorithm in fig. 12 to build the chain of the *Lanseloet van Denemerken* text versions; only the ten end groups in fig. 72 with seven or less members are used.

The end result of the application of the algorithm can also be presented in a simplified horizontal way, which is, perhaps, more clear:

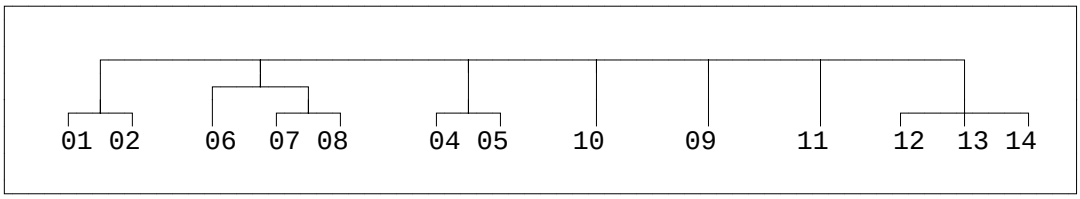

Figure 74. First handmade sketch of the *Lanseloet van Denemerken* chain.

I repeat that we are currently trying to get an impression of the *Lanseloet* chain. Later on, we will use PAUP to produce a computer-drawn chain.[120]

4.7.2. JUDGEMENT OF THE HANDMADE SKETCH OF THE *LANSELOET VAN DENEMERKEN* TREE: NO CONTAMINATION

Contamination, also known as, a.o., *text bastardy*, is a hot topic in text-genealogical research. When a copyist uses more than one layer text to produce a new copy of a text, this copy may contain elements of different text families. Contaminated copies hamper the efforts to build a historical family tree. For long text-genealogists have tried to find out how to recognize contamination. Sometimes, one gets the impression that most text traditions are afflicted by text bastardy. My contribution to the contamination topic, already mentioned in §2.8, is a simple advice. We can only detect contamination if we are (relatively) sure that the variants and formulas we use for our text-relational research are trustworthy. I am convinced that some text-genealogists have used contamination as a too easy explanation for their difficulties to develop text-genealogical trees. Often, the difficulties, in the shape of contradictory variation formulas, will not have been caused by contamination, but by an incorrect choice of (false) variants.

The chain in fig. 74 agrees with all the 45 variation formulas. This is remarkable, because it seems that the *Lanseloet* text tradition is an example of a text tradition which has not been afflicted by the bias of contradicting variation formulas, caused by contamination or other unexpected parallelisms. I checked whether I manipulated the formulas unwillingly to guarantee a positive result. All I can say is that I weaponed myself against my own manipulations by developing the chain at the end of my research. Admittedly, in the period in which I developed my theoretical insights and software, I was acquainted with the *Lanseloet* texts. I saw, for instance, that the German texts 06, 07 and 08 had some variants in common. But then again, the chain presented in fig. 74 was not yet developed, so how could I have manipulated myself or my theory or the formulas?

---

[120] Nevertheless, I offered the 45 formulas of fig. 71 to PAUP. The resulting PAUP chain was the same as our handmade chain in fig. 74.

4.7.3. MISSING VALUES: SOME EXTRA VARIATION FORMULAS ARE NEEDED; A SECOND HANDMADE SKETCH OF THE *LANSELOET* TREE

Aside from some reservations about the results being 'too good to be true', the handmade chain is acceptable as an end result of our research, because it expresses the relationships between the text versions. However, some minor details in the chain may require further investigation. I call them *minor*, because I can live with the fact that not all the details about the relationships of text versions are known. The chain is acceptable and trustworthy, but we are interested in some missing details. Let us take a look at them. First, the place of text 03 in the chain is unknown. As mentioned in fig. 57, incomplete text version 03 consists of only one text page. There are simply not enough good variants available to determine the position of text 03 in the chain. Second, the structure of end group 12-13-14-, which is not divided into subgroups, is unknown. This is due to a lack of the necessary variation formulas. Third, the relationships of texts 01 and 02 are not totally clear. The same is true for texts 04 and 05, and for texts 07 and 08.

The lack of some minor information leads us to question whether we have used all the information provided by the computer. Of course, we know that some type-2 formulas have not been treated yet, concerning, for instance, adjectives[121] and word order[122]. However, we still refuse to use them, because we still have doubts about their text-genealogical significance. Although we are not against the use of incorrect rhyming words as text-genealogically informative variants, in the *Lanseloet van Denemerken* case all the available detected violations of rhyming conventions in type-2 environment[123], can easily be repaired. Therefore, they are useless for our text-genealogical research. In other words, it seems that our type-2 wells have already been used or dried up.

Fortunately, we have not yet explored all the text-genealogical information: the type-1 variation formulas mentioned in Appendix D.[124] As we know, a type-1 formula consists of two competitive variants, of which one variant occurs in a single text version or in all-but-one text versions. In §2.4.3, we saw that, in general, we are not interested in type-1 formulas; one of the first characteristics of text-genealogical variants is that text-genealogists must work with type-2 formulas. Indeed, in an ideal situation we can build a chain with strictly type-2 variation formulas. But in a bit less ideal situation, with which we deal now, the

---

[121] See note 71 and Appendix D, §4.1.1.

[122] See §3.25 and Appendix D, §8.1.

[123] See Appendix D, §9.1.2.

[124] See Appendix D, §9.1.1.2 ('Violations of Rhyming Conventions in Type-1 Environment, Not Concerning Vowels'), §9.2.1 ('Duplicate Rhyming Words in Type-1 Environment'), §10.2 ('Inversion of Verses: Type-1 Variation Formulas'), 11.2.1.2 (''Empty' Verses in Type-1 Environment') and 11.2.2.2.1 (''Extra' Verses in T1 Environment: Judgement Philologist Needed').

available type-2 formulas may leave some (minor) questions about the structure of end groups of two or more members. Type-1 formulas may answer these questions.

As we discussed at the end of §3.2.2, a branch that connects texts with exactly the same genealogical characteristics has a length of zero, which means that it becomes potentially *collapsable* or *contractable*. At the end of that section, we saw that our default attitude does not stimulate but prevents the collapsing of zero length branches. We search for (type-1) variation formulas that show that two texts, in the first instance linked by a zero length branch, have different variants. Once such a variation formula is found, we know that the branch between both texts does not have a zero length and should not be collapsed. That is the reason why some sections of Appendix D show type-1 variation formulas; we can use them to show that it is forbidden to collapse certain branches.

If we do not find type-1 variation formulas for a text, this does not imply that such a text must be an intermediate node in the chain. I stress, that our default attitude will be that we avoid the collapsing of zero length branches. A text can only become an intermediate node under two conditions: 1. there are *no type-1 variation formulas* that show that the text is an end node; 2. there is *additional (non-textual) historical information* available (see the end of §3.2.2), that supports the idea that the text is an intermediate node and may have been for instance the forefather of another delivered text.

The software has the option to display all the potential type-1 formulas. However, if we used this option, the amount of potential variation formulas would almost double, implying a lot of extra work for the philologist. Since we use the type-1 formulas only to get more information about some minor details of the chain, we prefer to work with easily detectable and convincingly significant (*heavy*, non-trivial or non-accidental) type-1 formulas. Although we have not yet evaluated characteristics 9, 10 and 11b, it seems that violations of rhyme, the inversion of verses, and the addition or omission of verses generally offer trustworthy genealogical information which can be easily recognized.[125]

Now, we will examine the available type-1 formulas, text by text, in order to investigate which texts may be (potential) intermediate nodes and which texts must be end nodes.

---

[125] The consequence of working with heavy (non-trivial or non-accidental) type-1 variants is that no attention is paid to the less heavy (or less convincing) type-1 variants. Therefore, the software missed a type-1 variation which is mentioned by Hüsken & Schaars (1984:14): the fact that text 13 has as verse 13.257 ‘Ende liggen dan als een Katijf/’, where we would expect, based on the comparative verses of all other *Lanseloet van Denemerken* texts: ‘Ende sonder spreken dan als een Katijf/’. I am still convinced that type-2 variation formulas give good information about the general shape of a chain or stemma. We only use heavy type-1 formulas to discover minor, and in my view rather unimportant, details about a tree. If I would have had to take into consideration all the type-1 formulas, it would have implied a lot of extra work for little new information.

Text 01: Text H/BR=01 is in the manuscript Van Hulthem. In §10.2 of Appendix D we find type-1 formulas[126] concerning text 01 like:

```
02.0034 12 ^obs01: 01-|02-04-05-07-08-09-10-11-12-13-14-: rhyming
                   pair (~bewaren - ~sparen) of text 02 (near 02.34)
                   is inverted in text 01 (T1);10
02.0055 12 ^obs01: 01-|02-04-05-06-07-09-10-11-12-13-14-: rhyming
                   pair (~vrindinne - ~minne) of text 02 (near
                   02.55) is inverted in text 01 (T1);10
```

The first formula in §11.2.1.2 is:

```
02.0022 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-: 01- has
                   NO TEXT (T1);11b
(c. 03=nd.)
```

The 02.0022 formula indicates the uniqueness or non-intermediate position of text 01. We have italicized it too stress that it is a special (non-type-2) formula. Later on, we will add this and other italicized formulas in this section to the 45 detected formulas thus far.

Text 02: Text G/L=02 is the Gouda incunable, our base text. In §9.1.1.2 and §9.2.1 in Appendix D, we find the formulas:

```
02.0583    ?obs03: conventions pure rhyme violated in pair (~belast-
                   ~bedagt) of text 02- (near 02.583);T1?;9a
02.0827    ?obs01: the pair (~mode | ~mode) of text 02- near 02.827
                   consists of duplicate words;T1?;9b
```

Fig. 75 shows the 02.0827 verses and the second formula:

```
02.827 ende ok en man van hogen mode         < 02.827 Ende oec een man van hoghen moede [752]
01.850 ende en valiant ridder van hogen mode < 01.850 En(de) een vaelyant ridd(er) va(n) hoge(n)
(+)                                                                                  moede [773]
05.837 ende ok en man van hogen mode         < 05.837 Ende oeck een man van hoghen moede
06.839 int ok in man van hogen mode          < 06.839 Ind oec eyn man van hoghen mode
07.838 int og in man van hogen mode          < 07.838 Ind och eyn man van hoghen mode
08.838 int awg in man van hogen mode         < 08.838 Ind ouch eyn man van hogen mode
09.834 ende ok en man van hogen mode         < 09.834 Ende ooc een Man van hooghen moede/
10.842 ende ok en man van hogen mode         < 10.842 Ende oock een man van hooghen moede/
11.848 ende ok en man van hogen mode         < 11.848 Ende oock een Man van hoogen moede/
12.842 ende ok en man van hogen mode         < 12.842 Ende oock een Man van hoogen moede/
13.842 ende ok en man van hogen mode         < 13.842 Ende oock een Man van hoogen moede/
03*                                          < 03=>*
04*                                          < 04=>*
14.427 en ok en man van hogen mode           < 14.427 en oock een man van hoogen moede
-------------------------------------------------------------------------------------------
02.828 wel geboren ende rik van mode       < 02.828 Wel gheboren ende rijc van moede [753]
01.851 wel geboren ende rik van gode       < 01.851 Wael gheboren en(de) rijc van goede [774]
05.838 wel geboren ende rik van gode       < 05.838 Wel gheboren en(de) rijck van goede
06.840 wel geboren int rik van gode        < 06.840 Wael geboren ind rijck van goede
07.839 wel geboren int rik van gode        < 07.839 wael gheboren ind rick van goede.
```

[126] It is remarkable that in §11.2.1.2 of Appendix D (''Empty' Verses in Type-1 Environment') many formulas express the unique state of text 01. This is due to the fact that the verses of this text often could not be lined up with the verses of base text 02. Most of the 'Empty' verses occur only in the 01 text, not in the 01 text in (type-2) combination with one or more other texts. Compared with to other texts, text 01 is the most deviant: some 01 verses are completely different or have verses in another order. This results in many type-1 variation formulas, which are not treated in Appendix D, which is basically focused on type-2 formulas.

```
08.839 wel geboren unt rig van gode        < 08.839 Wail geboren vnd rich van goede
09.835 wel geboren ende rik van gode       < 09.835 Wel gheboren ende rijc van goede
10.843 wel geboren ende rik van gode       < 10.843 Wel gheboren ende rijck van goede
11.849 wel geboren ende rik van gode       < 11.849 Wel gheboren ende rijck van goede/
12.843 wel geboren ende rik van gode       < 12.843 Wel geboren ende rijck van goede/
13.843 wel geboren ende rik van gode       < 13.843 Wel geboren ende rijck van goede/
03*                                        < 03=>*
04*                                        < 04=>*
14.428 wel geboren en rik van gode         < 14.428 wel geboren en ryck van goede
```

```
02.0827    ?obs01: the pair (~mode | ~mode) of text 02- near 02.827 consists of duplicate
(+)                words;T1?;9b
02.0827 11 ^comb.: 06-07-08-|01-02-05-09-10-11-12-13-="int"|"ende" (^:W1=Co;W2=Co;4a+;4b-)
02.0827 12 ^comb.: 06-07-08-|01-02-05-09-10-11-12-13-14-="in"|"en" (<:e|1vow.;7b)
(+)                (^:W1=Mx;W2=Mx;4b-)
02.0827 12 ^treat: 2ch.wrd "ok" (Av) in 02-05-06-09-10-11-12-13-14- (rest: 01-07-08-); (^:small
(+)                word?);11a?
```

Figure 75. Output in Appendix C, *Lanseloet* verses 02.0827 (with the context of verses 02.0828 included): the software detects duplicate rhyming words in text 02.

We cannot use the two mentioned formulas immediately, because they do not yet contain information about the other *Lanseloet* texts. This is due to a small inconvenience in the software. Nevertheless, if we take a look at the contents of the *Lanseloet* texts (see fig. 75), we can easily rewrite the last formula as:

```
02.0827 12  ?obs01: 02-|01-05-06-07-08-09-10-11-12-13-14-: 02 has
                    the rhyming pair (~mode | ~mode) near 02.827
                    with duplicate words;T1?;9b
(c. 03+04=nd.)
```

This type-1 formula seems to indicate that text 02 has an end node position in the chain.[127] However, we must be cautious, because we dit not consider yet the relation of text 02 with text 03.

Text 03: Text G/DH=03 consists of only about thirty verses, near base text verses 02.0377 to 02.0408; texts 04 and 14 do not have a contents in this area. The verses do not offer convincing variants that can give us clear evidence about the relationship of text 03 to the other text versions.

Admittedly, we do find rejected (‘^comb’) variation formulas that seem to indicate that texts 02 and 03 are an end group, within an end group 01-02-03-.[128] For example, in fig. 76 we see that in the 02.0390 verses text 02 and 03 share the variant (in shorthand notation) ‘ni’, while text 02 has ‘not’.

---

[127] In Appendix D, §11.2.2.2.1 ‘Extra’ Verses in T1 Environment: Judgement Philologist Needed, it is mentioned that base text 02 shows an (unoriginal) break in the rhyme scheme at four places. In general, a verse is missing in text 02 while the other texts are complete. The formulas concerning these missing base text verses agree with the italicized formula for verse 02.0827.

Figure 77. Output in Appendix C, *Lanseloet* verses 02.0393: texts 02 and 03 have the same verses.

However, we must stick to our text-genealogical principles as long as possible. Characteristic 4b forbids us to use the variants ‘ni’ and ‘not’ (of fig. 76) for the development of text-genealogical trees, because both variants are adverbs. Unfortunately, texts 02 and 03 in fig. 77 do not share convincing, text-genealogical variants. We conclude that there are simply not enough good variants to determine the position of text 03 in the chain.

So far, the only formula in fig. 71 concerning text 03 is:

```
(18.) 02.0385 12 09-11-12-13-|01-02-03-05-06-07-08-10-="~sot"|
                 "~spot" (wds r.p;5)
```

```
02.385 ende geven mi graki ende spot       < 02.385 Ende gheuen mi gracie ende spoet [346]
01.409 ende grati wil geven ende spot      < 01.409 En(de) gratie wil gheuen en(de) spoet [370]
05.393 ende geven mi graki ende spot       < 05.393 Ende gheuen mi gracie ende spoet
06.393 int geven mir graki int spot        < 06.393 Ind geuen myr gracie ind spoit
07.392 int geven mir graki int spot        < 07.392 Ind geuen myr gracie ind spoit
08.392 int geven mir graki unt spot        < 08.392 Ind geuen myr gracie vnd spoit.

Figure 78. Output in Appendix C, *Lanseloet* verses 02.0385: the variant ‘spoet’ occurs in texts 01-02-03-05-06-07-08-10-.

This formula (see also fig. 78), indicates that text 03 can be found in the area of texts 01-02-(03-)05-06-07-08-10. This vague position of text 03 is not very satisfying. Of course, we want to give it a clear place in the *Lanseloet* tree.

Since no clarifying variation formulas are present, all we can do is to make use of the non-textual information about text 03. By doing so, we avoid the presentation problem (see p. 26) that our chain or stemma is less detailed than the *Lanseloet* trees presented earlier in this century.

We could criticize this *non-textual approach* by remarking that working with non-textual information is beyond the scope of this research, which is to find out whether stemmas can be built (automatically) by the computer.

Is the outcome of my research so far that the computer is too limited to draw detailed stemmas? Of course, it is impossible for me to give a universal answer to this question, which is true for all the text versions of all the kinds of texts in the world. I can only answer it for the case of the fourteen *Lanseloet van Denemerken* text versions. The outcome of my *Lanseloet* research is that the computer can build a *Lanseloet* tree with the text-genealogical characteristics, although the tree is not very detailed, due to a lack of variants concerning text 03 (with only one page of text) and some other texts. As we will see in §5.3, there is, in general, no need to assume that the text-genealogical characteristics are incorrect.

Is it the task of a researcher to stop all the investigations once the borders of the research are reached or even crossed? Normally it is. However, if the researcher is convinced that he can achieve new or better results - *in casu* a more detailed *Lanseloet* tree - by working ahead with some extra efforts, this work is acceptable or understandable. New or reinforced insights in the fields of stemmatology are always welcome.

One of the aims of this study is to show that the computer can perform tasks which are described in (subjective) hypotheses or characteristics in a consequent and verifiable way. The computer can extensively test the power, implications and limitations of such text-genealogical hypotheses concerning textual variants. It is (almost) impossible for an individual philologist to perform a theory that consequently. In other words, according to me, the computer is (almost) indispensable for the development and application of text-genealogical theories that work with textual variants.[129] But I stress that it is not my intention to 'forbid' the use of non-textual (non-automated) information to build stemmas. This study does not intend to say that text-genealogical research must only be performed with the help of the computer! In §2.3, for instance, I already stated: 'Other non-textual elements in texts, like the use of pictures, the number of lines on a page, etc., may provide genealogical information as well.'[130] The seventh text-genealogical basic principle in §3.3.2 clearly stresses the importance of (non-automated) philological insights.

Of course, I hoped that the computer would have detected enough well-spread type-2 variations to develop an accurate and detailed *Lanseloet* chain immediately. Unfortunately, there a not enough well-spread type-2 variations present. Therefore, we have to look further and take some type-1 variations into consideration as well. And we can also consider non-variant or non-textual information. I do not feel too uncomfortable when I cross the (automation) borders of my research. In fact, my 'non-textual' text-genealogical exercise clearly underlines the relative importance of computers in stemmatology; they are very important, but not 'holy' to me.

Now, I will continue to search for non-textual genealogical information in the *Lanseloet* texts, in order to draw a more detailed *Lanseloet* pedigree.

Roemans & van Assche (1982:46-47) show that it is likely that texts 02 and 03 are both printed by the same printer, Govert van Ghemen, at about the same time 1486/1488-1492. Furthermore, both texts show the same woodcut near base text verse 02.0377 that most likely came from the same engraved woodblock.[131] Therefore, it is probable that both texts are closely related.

---

[129] A reviewer of a previous version of this study remarked that this vision is not very pragmatic, since many philologists or stemmatologists do not know how to program a computer. Although it may sound unsympathetic, my response is simply that this *handicap* of my fellow-stemmatologists is not my problem. A theory or hypothesis must be performed consequently and must be verifiable and repeatable. If it is not, its value is questionable. I guess that within a few years general software will be available that offers all the textual variants occurring in text versions. Then every philologist can work with variants as demonstrated in this paper.

[130] In the near future, it will be possible to teach the the computer to work with non-textual elements as well. In Salemans (1994-95) it is demonstrated, for instance, that the computer can quite easily detect small differences between pictures.

[131] The woodcuts match, except that the woodcut in text 03 shows a small missing part in the under

This is expressed by the following new, artificial variation formula (in which there is no place for texts 04 and 14, since the contents of both texts of the 02.0377 verses are not delivered to us):

```
02.0377 12  comb.: 02-03-|01-05-06-07-08-09-10-11-12-13-: 02 and 03
                   show the same woodcut; probably they have both
                   been printed by Govert van Ghemen around 1490 (=
                   non-textual information)
(c. 04+14=nd.)
```

In the stemma the older text 02 may be the (intermediate) ancestor of 03.

Text 04: In the *Lanseloet* chain, displayed in fig. 74, we see that text A/BR=04 and A/M=05 are closely related. In the Appendix D sections with type-1 formulas concerning heavy violations of rhyme and the addition/omission of verses, we cannot find any type-1 formula that separates text 04 from the other texts. This may give rise to the thought that text 04 is an intermediate, and that it may have been the forefather of text 05. However, as we saw in §3.2.2, we must keep in mind that building chains on the basis of intermediacy has an inherent danger; the absence of indications (*c.q.* enough indications) that a manuscript is not intermediate does not guarantee that the manuscript actually is intermediate. If we can find a variant that is only present in text 04, while the other texts share another variant, text 04 cannot be an intermediate text.

One formula in §11.1.2.4 of Appendix D showes that in the 02.0206 verses something happened with the rhyming word of text 04 (and 01 and 14).

```
02.0206 13 ^treat: 5ch.wrd "~sagen" in 02-05-06-07-08-09-10-11-12-
                   13- (rest: 01-04-14-);11a?
```

Therefore, I decided to study the 02.0206 verses, presented in fig. 79:

```
02.206 dat heb ik dikwil horen sagen       < 02.206 Dat heb ic dicwil horen saghen [183]
01.245 nog ni en dede te genen dagen       < 01.245 Noch nie en dede te ghenen daghen [220]
05.206 dat heb ik dikwils horen sagen      < 05.206 Dat heb ick dicwils hooren saghen
06.208 dat hebbe ig dikwil horen sagen     < 06.208 Dat hebbe ich dicwijl horen saghen
07.208 dat hebbe ig duki vil horen sagen   < 07.208 Dat hebbe ich ducki vil horen saghen
08.208 dat hebbe ig duk wil horen sagen    < 08.208 Dat hebbe ich duck wijl horen sagen
09.205 dat heb ik dikwils horen sagen      < 09.205 Dat heb ic dicwils hooren saghen
10.212 dat heb ik dikwis horen sagen       < 10.212 Dat heb ick dickwis hooren saghen
11.214 dat heb ik dikwils horen sagen      < 11.214 Dat heb ick dickwils hooren sagen
12.213 dat heb ik dikwils horen sagen      < 12.213 Dat heb ick dickwils horen sagen/
13.213 dat heb ik dikwils horen sagen      < 13.213 Dat heb ick dickwils horen sagen/
03*                                        < 03=>*
04.78  dat heb ik dikwils horen gewagen    < 04.78  Dat heb ic dicwils horen ghewaghen
14.178 dat heb ik dikwels horen seggen     < 14.178 dat heb ick dickwels hooren seggen
```

borderline of the picture. This seems to suggest that text 03 was printed with a more used woodblock and that, therefore, text 02 is a bit older than text 03. However, we must be careful not to draw our conclusions too quickly. Such a missing part can be caused by the fact that the woodblock was not inked optimally as in the case of text 03. See also Goossens (1976).

```

Figure 79. Output in Appendix C, *Lanseloet* verses 02.0206: the word ‘gewagen’ is only to be found in text 04.

We see that the ten texts 02-05-06-07-08-09-10-11-12-13- have the shorthand word ‘~sagen’ in rhyming position while text (H/BR=)01 has ‘~dagen’, 04 has ‘~gewagen’ and 14 has ‘~seggen’. The readings of the fragmented text version 03 are not delivered. All the thirteen texts end in the previous verse (02.0205) with the same shorthand rhyming word ‘~magen’. Looking at the variants of verse 02.0206, we see that text 01 differs completely from the other texts. The variant ‘seggen’ in text 14 is more or less the same as ‘sagen’, but this variant is not trustworthy, since is does not rhyme with ‘magen’.

Notice that texts 01 and 14 are not very important for our current goal, which is to determine whether text 04 is an end node intermediate. Both texts stand at the left and right side of the *Lanseloet* chain (see fig. 74), while text 04 stands in its centre, far away from texts 01 and 14. Putting aside texts 01 and 14, we see that text 04 has a unique variant ‘gewagen’, while the other texts have ‘sagen’. Therefore, it is likely that text 04 has an end node position and not an intermediate position in the chain. We can prevent the contraction of the 04 branch by a new artificial (generated by me) type-1 variation formula, in which we act as if texts 01, 03 and 14 were not delivered:

```
02.0206 11  comb: 04-|02-05-06-07-08-09-10-11-12-13-: "gewagen"|
                  "sagen" (T1)
(a. 04 has ‘ghewaghen’, b. 02+05+06+07+09+10 have ‘saghen’, 08+11
have ‘sagen’, 12+13 have ‘sagen/’; c. 01+03+14=n.d.)
```

Text 05: We find many type-1 formulas that express the non-intermediate position of text A/M=05 in the chain.[132] We will use one of them to indicate the non-intermediate position of this text:

---

[132] In §9.1.1.2 of Appendix D we find observation formulas like:

```
02.0052    ?obs01: conventions pure rhyme violated in pair (~gelike - ~geboren) of text 05-
                   (near 02.51);T1?;9a
02.0705    ?obs01: conventions pure rhyme violated in pair (~geboren - ~weten) of text 05-
                   (near 02.703);T1?;9a
```

I add to these formulas that the other texts (except for non-delivered fragments of text 03 and 14) do not show a violation of rhyme. In §11.2.1.2 of Appendix D, we find formulas that indicate as well that text 05 shows clear errors:

```
02.0182 11 ^obs01: 05-|01-02-06-07-08-09-10-11-12-13-: 05- has NO TEXT (T1);11b
02.0416 11 ^obs01: 05-|01-02-06-07-08-09-10-11-12-13-: 05- has NO TEXT (T1);11b
02.1011 11 ^obs01: 05-|02-04-06-07-08-09-10-11-12-13-: 05- has NO TEXT (T1);11b
```

```
02.1011 11 ^obs01: 05-|02-04-06-07-08-09-10-11-12-13-: 05- has NO
                      TEXT (T1);11b
(c. 03+14=n.d.; text 01 has already finished)
```

Text 06: In the chain of fig. 74, text K/W=06 already seems to have an end node position. However, we cannot find any type-1 formula that forbids considering text 06 as an intermediate text (by contraction of the 06 branch). Admittedly, text 06 has the unique variant 'harsten' in the 02.0861 verses. But this evidently incorrect variant can be changed quite easily into the better 'haesten'. Therefore, the 'harsten' variant may not be used for text-genealogical purposes; it does not show that text 06 must be an end node.

As we saw in fig. 74, the Cologne printings 06, 07 and 08 are closely related. Text 06 was printed by Koelhoff, while 07 and 08 were printed by Heinrich von Neuss. Goossens (1976:216-217) claims that Heinrich von Neuss printed with Koelhoff's types and woodcuts. Ballard (1995:12), who gives a linguistic analysis of the language(s) used in texts 06 to 08,[133] suggests an deeper (economical) relationship between both printers: 'There is evidence to demonstrate that Heinrich von Neuss took over the printing business after Koelhoff's death.' Therefore, in stemmatic terms, it is not very dangerous to assume that text 06 was a forefather of text 07 and 08. Notice that we do not

[133] Ballard (1995:1): 'It is hard to imagine in this day and age that the city of Cologne, with a population of almost 40,000, ranked in importance with Paris and London in the late Middle Ages. (...) Cologne's great economic power was coupled with a considerable political and territorial influence. (...) Economic power and territorial acquisitions, of course, brought prestige to Ripuarian, the language of Cologne.' Ballard (1995:294): '(...) one of the questions of the dissertation was to determine whether or not each of the K texts was consistent with standard mediaeval Ripuarian.' A few lines further Ballard (1995:294) expresses that she has serious doubts about the correctness of the claim in Goossens (1973:64) that 'Die Sprache von K/G is im grossen und ganzen ripuarisch (...)'. Ballard (1995:295): 'Our findings from the charts in the preceding three chapters and the percentages of Ripuarian and non-Ripuarian features in each Cologne text indicate that none of the three Cologne versions of the Lanseloet text are truly Ripuarian, even though each of the texts show different degrees of Ripuarian linguistic features. The K/K text, the youngest text, comes closest to being identified as Ripuarian since this text has the highest incidence of Ripuarian forms for all linguistic categories tested. But this text reveals its non-Ripuarian basis most starkly in the rather modest percentage of Ripuarian forms in the morphological category. K/W, the oldest text, reveals the lowest incidence of Ripuarian forms, and cannot be identified as Ripuarian. K/G, the second oldest text reveals itself to be similar to the K/W version. Although this text does not have the lowest incidence of Ripuarian forms, it is similar to K/W in its ratio of Ripuarian to non-Ripuarian forms in each linguistic feature. The features which reveal the most about whether or not the K texts are Ripuarian are the morphological features. In all three texts the evidence of a non-Ripuarian provenance is most discernible in the morphology.' Ballard (1995:324-325) gives us information about the language used in K/W=06: '(...) I (...) guess that the mystery language is a dialect occurring in the transitional zone between the Ripuarian and Gelder regions (...). It is a recognised fact that educated readers in the Ripuarian-speaking area had at least a passive knowledge of mediaeval Dutch and were sophisticated enough to understand various neighbouring written dialects.' Ballard (1995:327) suggests that: '(...) the changes from K/G to the K/K version of the Lanseloet text is simply evidence of the acceptance of Ripuarian territorial supremacy in the Lower Rhine.'

claim that text 06 was the immediate forefather of, for instance, text 07, in the sense that text 06 was the layer text of text 07. As we discussed in §2.2, we can imagine lost text on or in the lines of chains and stemmas.

Text 07: In the Appendix D sections mentioning type-1 formulas concerning heavy violations of rhyme and the addition or omission of verses, we do not find formulas that indicate that text K/G=07 has its own specific characteristic which separates it from other texts. In other words, we do not have indications that text 07 is an end node in the chain. Since both texts 07 and 08 were printed by the same printer, Heinrich von Neuss, it is plausible that text 07 was an intermediate text, and was the forefather of the younger text 08.[134]

Text 08: In §9.1.1.2, §9.2.1, §11.2.1.2 and §11.2.2.2 of Appendix D, we find many observations or formulas that show that text K/K=08 must be an (non-intermediate) end node in the chain.[135] Except for the 02.0953 formula (caused by a displacement of a verse, which can easily be corrected by a copyist), several §11.2.1.2 formulas show that text 08 has unique lost verses, which cannot be easily repaired. An example is pictured in fig. 80.

```
02.986  a otmodig got van hemelrik          < 02.986  Ay oetmoedich god van hemelrijc [901]
01.1015 a otmodig got van hemelrike         < 01.1015 Ay oetmoedich god va(n) hemelrike [926]
05.996  a otmodig got van hemelrik          < 05.996  Ay oetmoedich god van hemelrijck
06.998  o otmodig got van hemelrik          < 06.998  O oetmoedich got van hemelrijc
07.997  o otmodig got van hemelrik          < 07.997  O oetmoedich got van hemelrick
08.996  o almegtig got van hemelrig         < 08.996  O almechtich got van hemelrich
09.993  a otmodig got van hemelrik          < 09.993  Ay ootmoedich Godt van Hemelrijc
10.1001 a odtmodig got van hemelrik         < 10.1001 Ay oodtmoedich Godt van Hemelrijck
11.1007 a otmodig got van hemelrik          < 11.1007 Ay ootmoedigh Godt van Hemelrijck/
12.1001 a otmodig got van hemelrik          < 12.1001 Ay ootmoedigh Godt van Hemelrijck/
```

[134] Two variants seem to indicate that text 07 is not an intermediate text. The first variant can be found in verse 08.0765, which has the evidently corrupt reading ‘O ede vrel auwe’, while text 06 has ‘O edele vrauwe’ and 08 has ‘O edel frauwe’. However, it is not unlikely that a copyist or printer could restore the evident error of text 07. The second variant can be found in verse 07.0803 in which the pronoun ‘vch’ is missing. The absence of this pronoun is so eye-catching and so easily restorable, that this variant does not provide us the proof that text 07 is not an intermediate node.

[135] In Appendix D, §9.1.1.2:

```
02.0057    ?obs01: conventions pure rhyme violated in pair (~ug - ~verdint) of text 08- (near
                   02.57);T1?;9a
02.0232    ?obs01: conventions pure rhyme violated in pair (~genogde - ~genog) of text 08-
                   (near 02.232);T1?;9a
02.0325    ?obs02: conventions pure rhyme violated in pair (~suverheden - ~wort) of text 08-
                   (near 02.324);T1?;9a
02.0945    ?obs02: conventions pure rhyme violated in pair (~vri - ~ansgin of text 08- (near
                   02.944);T1?;9a
```

In Appendix D, §9.2.1:

```
02.0594    ?obs01: the pair (~sin - ~sin) of text 08- near 02.594 consists of duplicate
                   words;T1?;9b
```

In Appendix D, §11.2.1.2:

```
02.0953 12 ^obs01: 08-|01-02-04-05-06-07-09-10-11-12-13-: 08- has NO TEXT (T1);11b
02.0961 13 ^obs01: 08-|01-02-04-05-06-07-09-10-11-12-13-14-: 08- has NO TEXT (T1);11b
02.0987 13 ^obs01: 08-|01-02-04-05-06-07-09-10-11-12-13-14-: 08- has NO TEXT (T1);11b
02.1003 11 ^obs01: 08-|02-04-05-06-07-09-10-11-12-13-: 08- has NO TEXT (T1);11b
```

It is remarkable that most disappeared verses in text 08 occur at the end of the text. We wonder whether the typesetter left out these verses on purpose, in order to save paper.

```

```

Figure 80. Output in Appendix C, *Lanseloet* verses 02.0987 (with the context of the verses 02.0986 and 02.0988 included): the software detects a missing verse in text 08.

We use the 02.0987 formula to point at the end node position of text 08:

```
02.0987 13 ^obs01: 08-|01-02-04-05-06-07-09-10-11-12-13-14-: 08- has
                   NO TEXT (T1);11b
(c. 03=n.d.)
```

Text 09: In the *Lanseloet* chain in fig. 74, text R/LO=09 already seems to be in end node position. However, if the 09 branch collapses, text 09 can become an intermediate (compare text 06). In Appendix D, §10.2, we find an observation formula that supports the conclusion that text 09 is and end node; it is not an intermediate text. In fig. 81 the formula and its context are pictured.

```
02.0522 09 ^obs01: 09-|01-02-05-10-11-12-13-14-: rhyming pair
                   (~haten - ~laten) of text 02 (near 02.522) is
                   inverted in text 09 (T1);10
```

```

(+)                T2?); (^:small word?);11a?
```

Figure 81. Output in Appendix C, *Lanseloet* verses 02.0522: text 09, with the inversion of verses, cannot be an intermediate text (in fig. 60 the accompanying verses 02.0523 are presented).

We use this formula as:

```
02.0522 09 ^obs01: 09-|01-02-05-10-11-12-13-14-: rhyming pair
                   (~haten - ~laten) of text 02 (near 02.522) is
                   inverted in text 09 (T1);10
(c. 03+04=nd.; text 06 has the non-shorthand rhyming pair ‘hassen -
lasen’, 07 ‘hassen - lassen’ and 08 ‘hassen - laissen’)
```

Text 10: Text A/LI=10 seems to be an an intermediate node in the chain, but it is an end node, as the next formula of §11.2.1.2 in Appendix D shows:

```
02.0523 12 ^obs02: 10-|01-02-05-06-07-08-09-11-12-13-14-: 10- has NO
                   TEXT (T1);11b
```

The 02.0523 verses are pictured in fig. 60. It is clear that in text 10 a verse is missing. To indicate the non-intermediate end node position of text 10 (compare also the 02.0108 verses in which text 10 has a unique rhyming word), we use this formula as:

```
02.0523 12 ^obs02: 10-|01-02-05-06-07-08-09-11-12-13-14-: 10- has NO
                   TEXT (T1);11b
(c. 03+04=n.d.)
```

Text 11: No heavy (i.e. non-trivial or non-accidental) type-1 formulas forbid the assumption that text 11 is an intermediate text. At first sight, §11.1.2.3 (Appendix D) seems to give us a small indication that text A/A=11 is an end node in the chain. This indication points at the 02.0123 verses, pictured in fig. 82:

```
02.123 al hat ik u binnen minen lande      < 02.123 Al hadic v binnen mijnen lande [108]
01.159 al hat ik u in vremden lande        < 01.159 Al haddic v in vremden lande [142]

```

Figure 82. Output in Appendix C, *Lanseloet* verses 02.0123.

The software tells us that it could not treat the shorthand pronoun ‘minen’, occurring in texts 02-05-06-07-08-09-10-12-13-14-. In text 11 the pronoun ‘min’, shorthand for ‘mijn’, occurs. For a moment, we could consider to create a type-1 variation formula 11-|02-05-06-07-08-09-10-12-13-14- for the variants ‘min’ and ‘minen’. Such a formula would give text 11 an end node position in the chain. But the formula is not genealogical, because the variants are pronouns, and because the difference between the variants is too small.

In other words, we did not find a text-genealogical formula that rejects the assumption that text 11 is an intermediate text. Remember, that we could not find any formulas that forbid to think that texts 02, 06 and 07 are intermediate nodes and that we decided that these texts can be intermediate nodes indeed. However, the absence of formulas was not the decisive factor in this decision. Decisive was that the potential intermediacy of texts 02, 06 and 07 was supported by *historical arguments*. For text 11 such historical arguments are not present. Therefore, as mentioned at the end of §3.2.2, we decide that text 11 is not an intermediate node.

Text 12: Text 12 is part of the group of texts U/P=12, U/LE=13 and S/BO=14. Since the sections with heavy (non-trivial or non-accidental) type-1 formulas do not have a type-1 formula with 12 as a unique group (with one member), it is not forbidden to assume that text 12 is an intermediate text. Hüsken & Schaars (1984:11-21) have developed a part of the *Lanseloet van Denemerken* stemma, focusing on texts 12, 13 and 14. We will speak about their research when we discuss text 13 and in §5.2.4.

Text 13: Text U/LE=13 is part of the group of texts 12, 13 and 14. There are no formulas that demonstrate that text 13 cannot be an intermediate. Text 12 and 13 were both printed by the van Poolsum family of printers in Utrecht, in

respectively 1684 and 1708, are very much alike. Based only on our text-genealogical variants, we conclude that both texts 12 and 13 could be intermediate nodes. We do know that in the stemma the younger text 13 cannot be the forefather of the older text 12. With this (non-textual) historical information about the age and provenance (the same printer family!) of texts 12 and 13, we conclude that it is possible[136] that text 12 is an intermediate or forefather of text 13. This agrees with the type-1 variation formula of Hüsken & Schaars (1984), mentioned in our footnote 125.

Text 14: In Appendix D, §10.2, we find a formula that indicates that text S/BO=14 is an end node in the chain and not an intermediate node. It is not mentioned by Hüsken & Schaars (1984):[137]

```
02.0777 13 ^obs01: 14-|01-02-04-05-06-07-08-09-10-11-12-13-: rhyming pair

```

---

[136] In the final part of §3.2.2, in which the notion *zéro caractéristique* is discussed, we explain why the word ‘possible’ is used here. The problem is that intermediacy is detected because of the (non-positivistic) absence of certain variants. The lack of variants cannot function as absolute evidence or proof that a text *is* an intermediate node. The zéro caractéristique only functions as an indicator that a text is *possibly* an intermediate node.

[137] Another formula, which is not mentioned by Hüsken & Schaars (1984), is offered in §9.2.1 (Appendix D). It seems to support the 02.0777 formula:

```
02.0077    ?obs01: the pair (~here - ~here) of text 14- near 02.77 consists of duplicate
                   words;T1?;9b
```

Looking at the other texts, we see that the first word of this pair must have been (in non-shorthand form) ‘eere’ and not ‘heere’. This is a small, text-genealogically uninformative, error, which can easily be repaired by copyists. The addition of an ‘h’ at the beginning of a word is a phenomenon that still occurs in Flemish dialects and the dialects of the current Dutch province Zeeland.

Other formulas, (probably intentionally) not mentioned by Hüsken & Schaars (1984), concerning texts 12, 13 and 14, can be found in Appendix D, §9.1.2.2.2:

```
02.0261 ?obs01: conventions pure rhyme violated in pair (~komen - ~jan) of texts
                09-10-11-12-13-14 (near 02.261);T2?;9a
02.0375 ?obs02: conventions pure rhyme violated in pair (~dorst - ~lust) of texts
                09-11-14- (near 02.375);T2?;9a
02.0375 ?obs03: conventions pure rhyme violated in pair (~durst - ~lust) of texts 12-13-
                (near 02.375);T2?;9a
```

```
10.793 want ik en gave om lantslots minne  < 10.793 Want ick en gave om Lantslots minne
11.799 want ik en gave om lanslots minne   < 11.799 Want ick en gave om Lanslots minne
12.794 want ik en gave om lanslots minne   < 12.794 Want ick en gave om Lanslots minne/
13.794 want ik en gave om lanslots minne   < 13.794 Want ick en gave om Lanslots minne/
03*                                        < 03=>*
04.303 want ik en gave om lantslots minne  < 04.303 <Wan>t ick en gaue om lantsloots minne
14.402 want ik en gave om lanslots beginne < 14.402 want ick en gave om lanslots beginne
```

```
02.0777 13 ^obs01: 14-|01-02-04-05-06-07-08-09-10-11-12-13-: rhyming pair (~beginne - ~minne) of

```

Figure 83. Output in Appendix C, *Lanseloet* verses 02.0777 (with the context of the 02.0778 verses included): the software detects an inversion of (the rhyming words of) the verses of text 14.

We will use this formula as:

```
02.0777 13 ^obs01: 14-|01-02-04-05-06-07-08-09-10-11-12-13-: rhyming
                   pair (~beginne - ~minne) of text 02 (near 02.777)
                   is inverted in text 14- (T1);10
(c. 03=n.d.)
```

Earlier in this paper we introduced 45 formulas (fig. 71). At this point, we can add several new formulas, which are presented in fig. 84. Partly, they summarize our findings: texts 02 and 03 are an end group, and texts 01, 04, 05, 08, 09, 10 and 14 are end nodes. From the rest of the texts we concluded that texts 02, 06, 07 and 12 could be intermediate nodes.[138]

```
46. 02.0022 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-:
    01- has NO TEXT (T1);11b
    (c. 03=nd.)
47. 02.0206 11   comb: 04-|02-05-06-07-08-09-10-11-12-13-:
    "gewagen"|"sagen" (T1)
    (a. 04 has ‘ghewaghen’, b. 02+05+06+07+09+10 have ‘saghen’,
    08+11 have ‘sagen’, 12+13 have ‘sagen/’; c. 01+03+14=n.d.)
48. 02.0377 12  comb.: 02-03-|01-05-06-07-08-09-10-11-12-13-: 02
    and 03 show the same woodcut; probably, they have both been
    printed by Govert van Ghemen around 1490 (= non-textual
    information)
    (c. 04+14=nd.)
```

[138] I summarize our findings. We saw that text 02 could be an intermediate or, in stemma terms, a forefather of the younger text 03. Admittedly, it is dangerous and difficult to show that a text is an intermediate node. However, in the case of texts 02 and 03, this danger is small, since both texts were printed by the same printer. We assume that text 07 and the younger non-intermediate text 08 were printed by Heinrich von Neuss. Logically, it is not very dangerous to assume that text 07 is an intermediate text. Text 06 was printed by Koelhoff. Most likely Koelhoff and von Neuss had a close economical relation; Heinrich von Neuss took over the Koelhoff’s business, as Goossens (1976) and Ballard (1995) claim. Therefore, text 06 could be an intermediate node as well. We have weak indications that text 11 is an end node. Texts 12 and 13 were printed by the van Poolsum printers family. Therefore, it is again quite plausible that the older text 12 was the forefather of text 13.

```
49. 02.0522 09 ^obs01: 09-|01-02-05-10-11-12-13-14-: rhyming pair

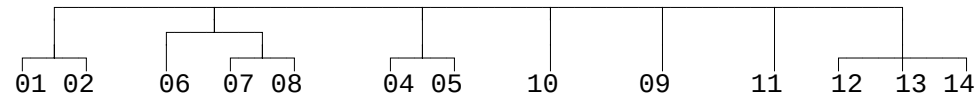
```

Figure 84. Nine extra *Lanseloet* variation formulas 46 to 54, as an Appendix to formulas 1 to 45 in fig. 71.

With these formulas 46 to 54 we can improve our chain, as pictured in fig. 85.

The first sketch of the *Lanseloet* chain was (see fig. 74):



We can adapt this sketch with the extra formulas 46 to 54. a. text 03 is grouped close to text 02; b. text 14 gets its own branch within the group of texts 12, 13 and 14 (see also §4.7.4.3); c. the variation formulas leave open the possibility that texts 02, 03, 06, 07, 11, 12 and 13 are intermediate texts. It is likely that texts 02 and 03 were printed by G. van Ghemen, 07 and 08 by H. von Neuss, text 06 by Koelhoff (economically closely related to von Neuss) and texts 12 and 13 by a member of the van Poolsum family. Having this **decisive historical informa-mation**, it is not very dangerous to assume that the older texts 02, 06, 07 and 12 are intermediate nodes. This possible interme-diacy of these texts is visualized in the branches by the text numbers between brackets '()' at the intermediate nodes above them. This leads to the second, more detailed, sketch of the *Lanseloet* chain.

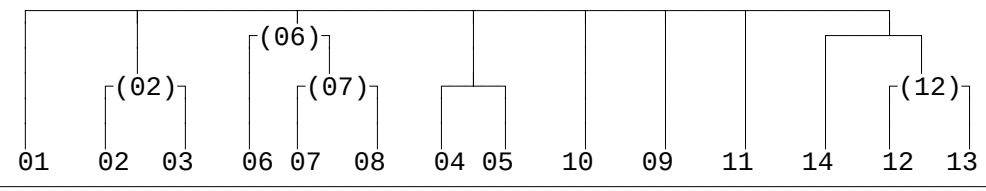


Figure 85. Second, (with the help of the nine extra formulas) more refined, handmade sketch of the *Lanseloet van Denemerken* chain.

4.7.4. THE *LANSELOET VAN DENEMERKEN* TREE AS DEVELOPED BY THE CLADISTIC SOFTWARE PACKAGE PAUP

4.7.4.1. Transforming the Variation Formulas into NEXUS Format

Now that we have an impression of the shape of the *Lanseloet* chain, it is time to see what this tree will look like when generated by the cladistic software package PAUP. First, we must (re)construct[139] our 54 formulas in such way, in so-called NEXUS shape, that PAUP can work with them. We take the first formula in fig. 71, reprinted at the top of fig. 86, as an example. Texts 09-11-12-13-14- have the same value; they share the fact that they do not have a verse at that spot (see fig. 56 on p. 102 or fig. 196 on p. 295). Texts 01-02-04-05-06-07-08-10- have another common value, since they do have a verse on that spot. Text 03 was not delivered; we say that this text has a 'missing value'. Now, we substitute 'the same value' for the number '0', 'another common value' for the number '1' and 'missing value' for '?', as pictured in fig. 86. The choice for '1' and '0' is arbitrary and does not say anything about the (un)originality of the variants. Of course we use two, and not three or more, values because the formulas we work with are type-2 variation formulas with two competitive variants.

```
01. 02.0039 13 09-11-12-13-14-|01-02-04-05-06-07-08-10-: first
    group (T2) have NO TEXT;11b;
(c. 03=nd.)
```

Texts:	01	02	03	04	05	06	07	08	09	10	11	12	13	14
Values:	1	1	?	1	1	1	1	1	0	1	0	0	0	0

Figure 86. Example of the transformation of variation formula 01 into NEXUS shape, using values '0', '1' and '?'.

The result of the substitution of the 54 variation formulas concerning the 14 *Lanseloet* texts, using the value symbols '0', '1', and the missing value symbol '?', is printed in fig. 87. We see the 54 variation formulas in the vertical columns. The fourteen texts are printed at the left, with their 'official' codes, like 'H/BR', followed by one or two dots and then followed by the codes '01', '02', etc., for the texts. After these text codes appears a string of 54 characters '1', '0' and '?'. The horizontal string with fourteen values '11?11111010000' for variation formula 01 in fig. 86 is printed in fig. 87 in a vertical column.

[139] See also fig. 25, the end of §3.2.4 (about the missing value '?', which softens the type-2 limitation), and fig. 88.

Figure 87. Matrix with the 54 *Lanseloet* variation formulas in NEXUS shape.

The first seven rules (from '#NEXUS' to '[1234567890 ....01234]') and the last two rules (';' and 'end') in fig. 87 are, more or less, part of the 'NEXUS'-format. If these starting and final rules are not present, the PAUP-software cannot deal with them. It is not necessary to understand them.

4.7.4.2. Measuring Distances between Texts

Fig. 87 offers us a compressed view of the differences between the texts. We clearly see, for instance, that texts 12 and 13 (presented in the figure with the sigla 'U/P' and 'U/LE' in front of them) do not differ at all. They share all the 54 values. Furthermore, we see that texts 13 and 14 only have different values for formula 51: 13 has the value '1', while 14 has '0'; text 14 shows many missing values '?', where text 13 has the values '0' or '1'.

It is easy to determine distances between texts using fig. 87. The distance between two texts in a chain or tree is the amount of different variants (or values) between the texts. In fig. 88 this is demonstrated for texts 05 and 06. The (temporary) *minimal distance* between both texts is '12', because they have different values in twelve formulas. When PAUP replaces the missing values by '0' or '1' both texts will have a different value in one extra formula. Then the (actual or definite) minimal distance between both texts is '13'.

```
   [       0---+----1----+----2----+----3----+----4----+----5---- ]
   A/M..05 11111110111101111111001?01?000110111101111111111111110
   K/W..06 11001110111111111010001001010111?11101101111101111?11111
 Diff's:     II        I   I I   q  qI I  q   II I    I    q    I

Texts 05 and 06 have different values in 12 formulas, denoted by
'I', by which the temporary minimal distance is '12'. Currently,
it is unclear how both texts differ in four formulas, as denoted by
'q'. PAUP will replace missing values by '0' or '1'. In this case,
PAUP will replace the four question marks as pictured below. Only
one of the four substitutions of a question mark gives the result
(in variation formula 23) that texts 05 and 06 have different
values. This implies that the actual minimal distance between texts
05 and 06 is '13'.

   [       0---+----1----+----2-----+---3----+----4----+----5---- ]
   A/M..05 11111110111101111111001101000011011110111111111111111110
   K/W..06 11001110111111111010001001010111011101101111011111111111
Diff's:      II        I   I I   I   I I      II I    I         I
```

Figure 88. The *temporary minimal distance* between texts 05 and 06 is 12; their *actual minimal distance* is 13 (once the missing values '?' have been substituted by '0' or '1').

At the end of §4.7.4.3, we will discuss the meaning of the distances in the *Lanseloet* chain further.

4.7.4.3. The Chain of the *Lanseloet van Denemerken* Texts as Drawn by PAUP; the Trustworthiness of the Chain

Let us see which tree will result when the formulas in NEXUS-format (see fig. 87) are offered to PAUP, installed on a Macintosh SE computer. The PAUP chain is presented in fig. 89. For presentational reasons the PAUP tree has been turned 90 degrees (compare figs. 27 and 28). It was produced with the PAUP ordering option 'ladderize left' and with the search option 'branch and bound'.

How trustworthy is this chain and the relationship between the texts expressed by it? We have 54 variation formulas, with values '0' and '1'. Therefore, the tree, in which all the variation formulas are present, has a minimal total length of '54'. In trees with contradicting variation formulas the actual tree length is always longer than its minimal length. In our case, there are no contradicting formulas. When we count the lengths of the branches in fig. 89, we see that the actual or realized length of the tree or network is 54. In other words, the minimal length is equal to the actual length. Given the 54 variation formulas, it is not possible to draw a better tree or network. Therefore, the CI or Consistency Index (see §2.5.5), expressing the tree's trustworthiness is maximal, as PAUP confirms: CI = 1.000.

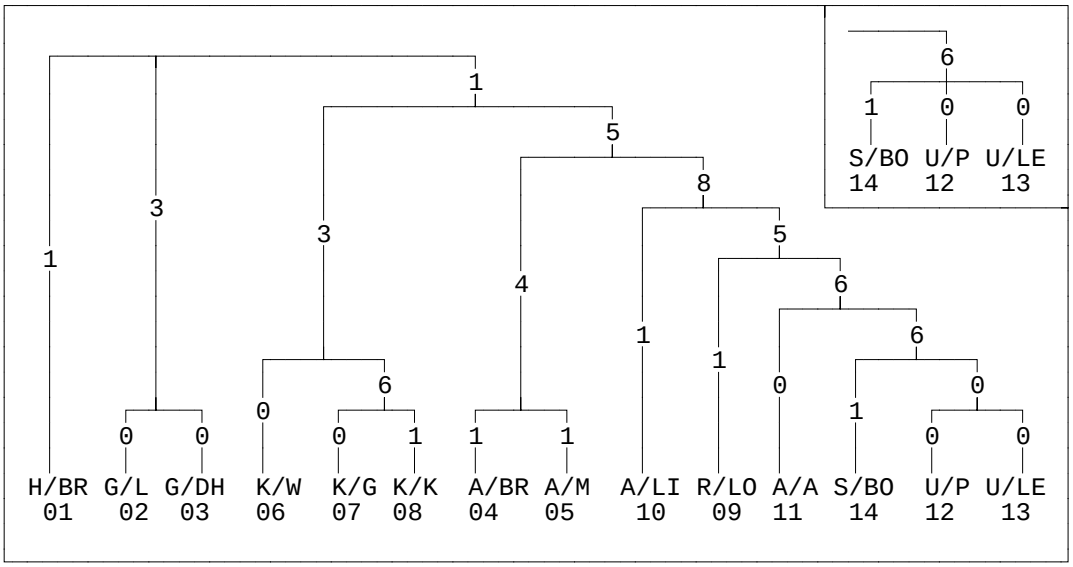

Figure 89. The chain of the *Lanseloet van Denemerken* texts as developed by PAUP. The numbers on the lines of connection represent the distances or numbers of the different variants. In the upper right corner an alternative part of the chain is drawn, concerning texts 12, 13 and 14.

In other words, given the 54 formulas the presented tree is very trustworthy. There is no bias; no variation formulas contradict the tree. Therefore, we do not have any reason to doubt the quality of the tree. Perhaps our tree would have been more convincing if it had been built with more than 54 formulas. Unfortunately, the computer does not find or produce more formulas (that agree with our text-genealogical characteristics). We could ask ourselves how many variation formulas are minimally needed to draw a tree of fourteen texts {a,b,c ... n}. The minimum amount is thirteen: (1) a:bcdefghijklmn, (2) ab:cdefghijklmn, (3) abc:defghijklmnop, (4) abcd:efghijklmnop, (5) abcde:fghijklmn, (6) abcdef:ghijklmn, (7) abcdefg:hijklmn, (8) ijklmn:abcdefgh, (9) jklmn:abcdefghi, (10) klmn:abcdefghij, (11) lmn:abcdefghijk, (12) mn:abcdefghijkl, (13) n:abcdefghijklm. If we leave out the two type-1 variation formulas (1) and (13), the minimum amount is eleven variation formulas. In other words, with our 54 formulas, we have far more than the minimum amount of variation formulas required. But of course, we would have preferred to work with more than 54 formulas.[140] Unfortunately, they are simply not present.

---

[140] Possible criticism is that the lack of contradiction in the formulas is caused by the selective way I treat the variants and formulas. Indeed, I accept only a very few formulas as good, text-genealogically trustworthy, formulas. Therefore, the chance that formulas contradict is limited. Nevertheless, it is remarkable that *all* the 54 formulas agree and cause no bias. The chance that an arbitrary set of 54 variation formulas concerning 14 text versions do not show any contradictions is extremely low.

PAUP confronts us with a small problem. It does not produce a single *Lanseloet van Denemerken* tree, but two trees, both with a length of 54. Both chains differ only slightly in the presentation of texts 12, 13 and 14. In the first chain, as pictured in the main part of fig. 89, texts 12 and 13 are one group, just like we expected (see fig. 85 or 90b). In the second tree, the deviating part of which is pictured in the upper right corner of fig. 89 (or 90a), texts 12, 13 and 14 are one group. Admittedly, we did not expect this. However, PAUP is correct. Variation formula 51 (see fig. 84) informs us that text 14 must be an end node. Therefore, it cannot be an intermediate node. However, this does not necessarily imply that texts 12, 13 and 14 belong to different families. In fact, they may have a common intermediate node, from which the three texts sprout.

We should not be too worried by the differences between these possible PAUP chains, because their mutual differences are small. We should consider that texts 12 and 13 are more or less the same, as we discussed on page 169. It is likely that text 12 is a forefather of text 13. Then, both figs. 90a and 90b lead to the same chain construction, as pictured in 90c.

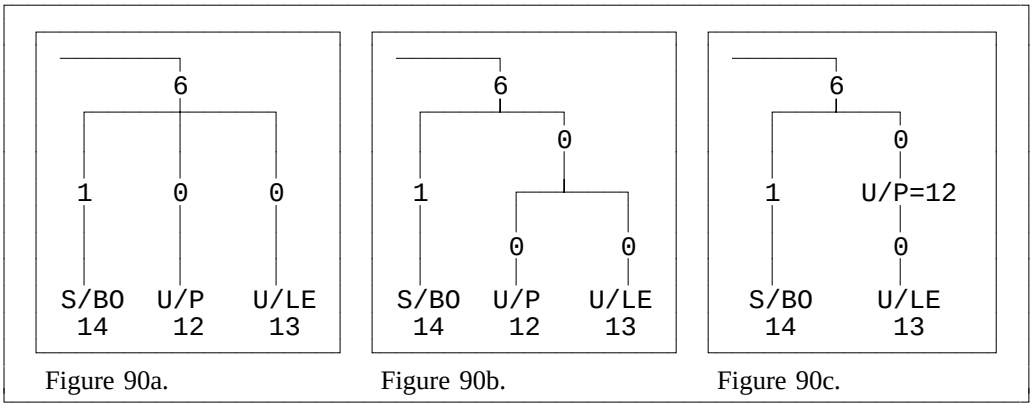

Figure 90a. Figure 90b. Figure 90c.

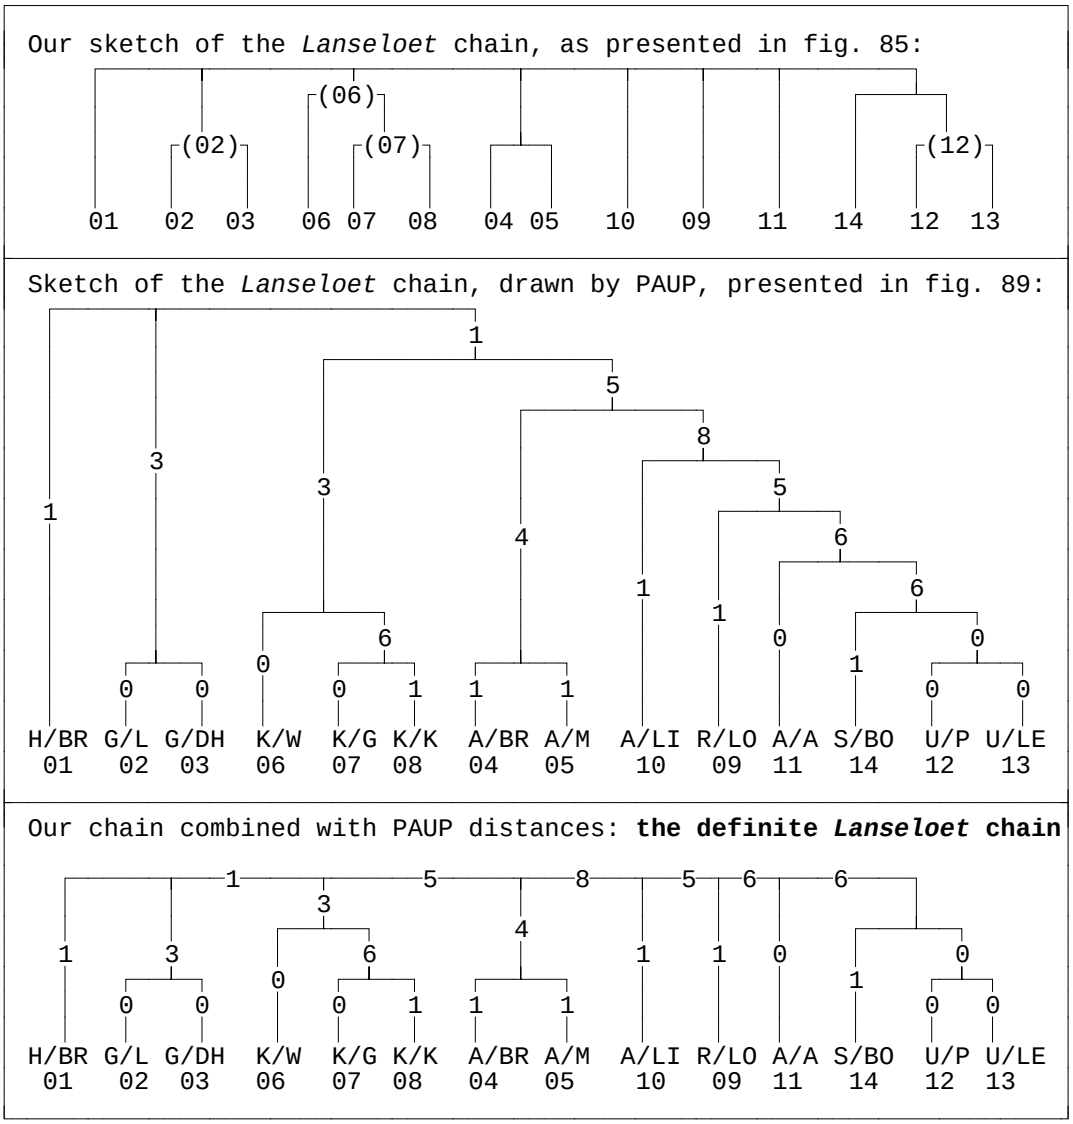
Figure 90. Two different chain parts for texts 12, 13 and 14, pictured in figs. 90a and 90b. Both parts are equal if the text 12 branch collapses, as demonstrated in fig. 90c.

Now, we check whether the PAUP chain in fig. 89 agrees with our own chain, as presented in fig. 85. At first sight, the ‘ladderized’ PAUP chain looks like a stemma and does not offer an ideal presentation of the *Lanseloet* chain (see also note 27). However, the chain drawn by PAUP agrees totally with ours. This will become more clear, once we have filled in the PAUP distances of the branches in our chain, as has been visualized in fig. 91. In the lower box in this figure the definite *Lanseloet van Denemerken* chain is presented.



Our sketch of the Lanseloet chain, as presented in fig. 85:

01 02 03 06 07 08 04 05 10 09 11 14 12 13
Our chain combined with PAUP distances: the definite Lanseloet chain
H/BR G/L G/DH K/W K/G K/K A/BR A/M A/LI R/LO A/A S/BO U/P U/LE
01 02 03 06 07 08 04 05 10 09 11 14 12 13

Figure 91. The definite chain of *Lanseloet van Denemerken* (presented in the lower box).

In §4.7.4.2, we discussed the meaning of *distance*. The total sum of the distances (1+0+3+0+0+1+0+3+0+6+1+5+1+4+1+8+1+5+1+6+0+6+1+0+0+0) of the *Lanseloet* chain is ‘54’. This equals the amount of variation formulas in which the variants have values of ‘0’ and ‘1’. How great is the distance between, for instance, texts H/BR=01 and S/BO=14? As seen from text H/BR=01, the path to S/BO=14 contains chain pieces with the distances 1+1+5+8+5+6+6+1. Therefore, the distance between them is ‘33’. This number implies that in 33 of the 54 simple variation formulas both texts have different variants; 33 variation formulas explicitly express that texts H/BR=01 and S/BO=14 belong to different families.

What about the remaining (54-33=) 21 formulas? Do they all express the contrary, namely that H/BR=01 and S/BO=14 belong to the same family? The most straightforward answer is: no, the number '33' only provides information about the differences between texts. Admittedly, in the remaining 21 formulas, H/BR=01 and S/BO=14 do share the same variants. This does not necessarily imply that these texts are closely related. We must take into consideration that among those 21 formulas we have, for instance, six formulas that express that texts K/G=07 and K/K=08 have variants which do not occur in the other twelve texts. In fact, as we will learn from the stemma in fig. 110, these six variants are unoriginal variants ('errors'), occurring for the first time in the common forefather of texts K/G=07 and K/K=08. We could say that these six variation formulas only concern the two Cologne texts, not the other texts. Summarizing, we can use the distances to measure differences between texts or text families. The greater the distance, the more distant the relationship.[141]

4.8. THE DEVELOPMENT AND PRESENTATION OF THE *LANSELOET VAN DENEMERKEN* STEMMA

4.8.1. INTRODUCTION

As explained in §2.4.5, a chain is the deep-structure of a stemma. We can turn a chain into a stemma by pulling up the chain at a *point of orientation*. Chains can be built without judgements about the originality of the variants. The disadvantage of the old method of Lachmann is that it develops stemmas without a chain, with variants, which the philologist has to judge as to their originality. Often these *subjective judgements* are difficult to make. When building a chain, such judgements are not necessary, although the selection of suitable variants is not simple. However, if we want to produce a stemma from a chain, we must judge some of the variants as to their originality.

Orienting the *Lanseloet* chain (fig. 91) into a stemma is not as easy as might be expected. The point of orientation does not automatically lie in the neighbourhood of the oldest texts, in our case texts 01 and 02/03. Since we can

---

[141] Perhaps the numbers expressing the distances are too vague for some readers. We could say that, in our case of *Lanseloet van Denemerken*, a small distance of '0' to '4' between two *Lanseloet* texts implies that both texts are 'very closely related'. If the distance between two *Lanseloet* texts or text families is between '5' and '8', this denotes a 'close relationship'. We tag a distance between '9' and '12' as a 'distant relationship'. Finally, when the distance is greater than '12', we may speak of a 'very distant relationship'. Of course, this tagging system is rather arbitrary, since there are no criteria to determine which distance denotes which relationship. However, if we use this system, we can say that texts H/BR=01 and S/BO=14 (with a mutual distance of '33') have a very distant relationship. The text family with the texts H/BR=01, G/L=02 and G/DH=03, and the text family with the texts K/W=06, K/G=07 and K/K=08 are very closely related, since their distance is '1'.

imagine lost texts on the connecting lines in a chain, the point of orientation can lie on each connecting line. Therefore, each connection line can be as old as the lost original text. We will use an example to illustrate this. Suppose that the lost original text lies between the groups 01-02-03-04-05-06-07-08-10- and 09-11-12-13-14-, near the point where now the distance '5' is printed, and that the lost original *Lanseloet* text dates from the year 1350. In §4.2, we saw that the oldest text of the first group, text 01, dates from around 1415. Text 09, as the oldest text from the second group, was produced around 1612. If we oriented the chain into a stemma at the denoted point '5', this would lead to two branches sprouting from the lost original text. One branch would connect the original to the first group, covering a time span from the year 1350 to 1415. The second branch would cover a time span from 1350 to 1612. In other words, knowing the dates when the fourteen texts were produced cannot help us determine the point of orientation.

We cannot build the stemma from the chain without judging some of the variants. We search for variants in our variation formulas, hoping to find some variants about which the judgement as to their originality is easy to pass. It would, of course, be convenient, if we could use our sixteenth variation formula

```
02.0346 12 01-02-|05-06-07-08-09-10-11-12-13-14-="ansgin"|
           "(h)an(ge)sigt(e)"
```

and say that the non-shorthand word 'a(e)nschijn' was the original reading. Then we would know that the point of orientation must lie in the neighbourhood of texts 01 and 02. Unfortunately, it is not that simple. There are not any arguments to support this convenient conclusion.

4.8.2. Determination of the Point of Orientation

In order to determine the point of orientation in the chain, we must find a place on it that only shows original variants (see §2.4.5 and figs. 23a and 23b). There are three ways to detect this (original) place in a chain. The first, *positive*, way is to detect *original areas* in the chain. Theoretically, the judgement of two formulas could lead us to the point of orientation. For instance, if it is plausible that two type-1 formulas like 09-:01-02-03-etc. and 10-:01-02-03-etc. resp. text 09 and text 10 have original readings, we know that the original point lies between texts 09 and 10. The second, *negative*, way is to find *unoriginal areas* in the chain. If we know where the unoriginal areas are, we can also recognize the original areas. The third way to detect the point of orientation is to combine our knowledge of unoriginal and original areas.

In the next paragraphs we will see that it is difficult to determine the point of orientation on the chain of *Lanseloet van Denemerken*. Therefore, it is difficult to develop the *Lanseloet van Denemerken* stemma. However, from a theoretical point of view this is not a problem, because, in chapter 5, we will only use the *Lanseloet* chain to evaluate our text-genealogical characteristics.

4.8.2.1. First Attempt to Find the Point of Orientation

The detection of *(un)original areas* in the chain is not simple. We are confronted with the Lachmannian problem that it is difficult to judge the (un)originality of variants, especially if our eyes or thoughts are not trained in these matters. Nevertheless, some judgements about the originality of variants are inevitable if we want to change a chain into a stemma.

I recall (see p. 18 and 50) that the notion *originality* refers to the archetypus text, and not necessarily to the lost original text. In other words, with *the original variant* I intend to say *the variant as present in the archetypus* or, therefore, *the variant which is the most close to the lost original text*. During the *emendatio* phase, unoriginal elements are removed from the archetypus text.

I developed four criteria, inspired by Leendertz (1907) and the studies of Duinhoven (see References), to detect (un)originalities in the *Lanseloet van Denemerken* text versions:

a. The *rhyming pairs criterion*. Normally, *Lanseloet* verses rhyme. If they do not, the non-rhyming verses, or at least their final words, carry an unoriginal element in them. Violations of rhyme can be detected by the computer. However, my software is very strict; it analyses assonant rhyme as imperfect rhyme.[142] We are interested here in heavy, more striking, non-assonant violations of rhyme.

   Every *Lanseloet* text consists of the rhyming couplets aa-bb-cc-dd (etc.). The computer easily finds 'orphan' verses breaking this pattern. If the rhyme scheme looks like aa-b-cc-dd, it means that one or more verses may have been added or deleted, causing a disruption in the normal rhyme scheme, an unoriginal element.

b. The *rhyme of the first verse criterion*. The general structure of a *Lanseloet* text consists of clauses spoken by one of the characters in the drama. Normally, the first verse of a new clause rhymes with the last verse of the preceding clause.[143] If this general pattern is broken or violated, which can be detected by the computer, we know that we have spotted an unoriginality.

c. The *evident error criterion*. Evident errors that occur in two or more texts (and possibly even occurring in complex, non-type-2 variations) can be used as indicators of unoriginal areas in the chain, provided that these texts are side by side in the chain.

   Perhaps this criterion will come as a surprise. First, we know that evident errors (like orthographical mistakes, nonsense text or other parallelistic variants), cannot be used for the development of a chain. Second, so far, we have worked with end groups of simple (type-1 and type-2) variations to build chains; working with groups of complex variations was forbidden.

---

[142] See also note 203.

[143] Leendertz (1907:XXII): 'Overal rijmt de eerste regel van een spreker op den laatsten van den vorigen.'

Indeed, evident errors are useless for the composition of the chain. But once we know the chain and want to produce a stemma from it, the evident errors may be useful. The point is that evident errors may survive a while, which gives us an indication about the unoriginal areas in the chain.

Let me illustrate this with an example. Suppose, that we know that five texts V, W, X, Y and Z were delivered as follows: V is the layer text of W, W of X, X of Y, and Y of Z - a perfect vertical stemma. Suppose now that X and Y have the incorrect name 'Marria', while the other texts have the correct 'Maria'. In other words, we have a type-2 variation formula X-Y-|V-W-Z-. If we use this formula to develop the chain, we could conclude that both X-Y- and V-W-Z- are end groups. This would lead to an incorrect chain. The fact that X and Y have the incorrect 'Marria' should not be used for the development of the chain. Nevertheless, the occurrence of the (parallelistic) variant 'Marria' gives texts X and Y a special bond. The unoriginal variant shows that they are closely related (although they do not need to be an end group) and that they may share an unoriginal element. Once the chain is built with trustworthy variation formulas, we can use 'Marria' to denote an unoriginal chain area.

Why does the criterion mention the condition 'provided that these texts are side by side in the chain'? With 'side by side' I mean that it must be possible to draw a path in the chain from one text to the other in such way that: a. the path does not contain one of the other text versions; b. on the path no (intermediate) branch nodes may be crossed which are connected to other text versions. The reason for this principle is simple and pragmatic. If the texts do not stand next to each other in the chain, the evident error is, apparently, not a binding error. If they stand side by side, it is very likely (but, admittedly, not absolutely certain!) that it is a binding error.

d. (Closely related to criterion a:) The *same rhyming word criterion*. If two verses that rhyme and end with exactly the same word, we can assume that at least one of these final words is unoriginal. The occurrence of the same rhyming word twice can be easily detected by the software.

The first two criteria are simple and sound, almost beyond discussion. The third and fourth criteria are more complex. Therefore, we prefer to use the first two criteria to determine the unoriginal areas in the chain.

Notice that we can teach the computer to use or apply three of the four criteria. In other words, at least a part of the orientation process can be automated. Notice, furthermore, that it is our goal to orient the chain into a stemma with the help of detected (un)originalities. We do not need to find or try to restore the original contents: this process of restoring the original, the *emendatio*, is performed after we have built the stemma.

Although we have our criteria, the process of determinating the point of orientation in the chain is still a delicate and uncertain matter. Fortunately, we do

not stand alone. In Leendertz (1907) and Duinhoven (1977, 1979a, 1980a), among others, we can find judgements about the originality of several *Lanseloet* variants or fragments. Duinhoven pays especially attention to one text, the 'manuscript Van Hulthem', text H/BR=01. He claims that several passages in this text cannot be original. Unfortunately for our orientation goal, he generally does not take into consideration the other *Lanseloet* texts. Leendertz (1907) judges the originality of many variants occurring in several *Lanseloet* texts.

Here is what I decided to do. First, I tried to judge for myself with the help of the criteria (and the computer output) whether several variants in the *Lanseloet* texts were original. Then, I compared my judgements about the (un)originality of variants to the Leendertz's (1907) findings. Furthermore, I decided to make two attempts to find the point of orientation in the *Lanseloet* chain. I will describe the first attempt now; the second attempt will be presented in the next section.

The first attempt. Several formulas (of Appendix D) show, possibly in combination, that the group 09-10-11-12-13-14- has unoriginal variants.

```
02.0261 13 ^comb.: 09-10-11-12-13-14-|01-02-04-05-06-07-08-=
                   "~komen"| "~dan" (wds r.p;5) (conventions pure
                   rhyme violated;9a)
02.0039 13  obs01: 09-11-12-13-14-|01-02-04-05-06-07-08-10-: first
                   group (T2) have NO TEXT;11b;
02.0045 12 ^comb.: 09-10-|01-02-05-06-07-08-11-12-13-14-="~ho"|
                   "~war" (wds r.p;5) (conventions pure rhyme
                   violated;9a)
```

Normally, one formula is sufficient to demonstrate that a group of text versions may contain unoriginal variants, and, therefore, cannot contain the point of orientation. (Because the judgement of the originality of a variant is difficult to make, I offered three formulas.) The 02.0261 formula is illustrated in fig. 92, showing verses 02.0259 to 02.2622.

With fig. 92 at hand, we can make two observations. First, the verses of the group 09-10-11-12-13-14- do not rhyme (see the rhyming pairs criterion a), which means that they are likely to be unoriginal.[144] Second, as remarked as well by Leendertz (1907:XXII), only text 01 is in agreement with the rhyme of the first verse criterion b, because the first verse of a new clause rhymes with the last verse of the previous clause only in this text. Probably, the transformation order was as follows: the verses as in text 01 changed into the verses as in texts 02-04-05-06-07-08- and then into the verses as in texts 09-10-11-12-13-14-.

---

[144] The other two formulas confirm our detection of the first unoriginal area in texts 09-10-11-12-13-14- in the chain. Group 09-11-12-13-14-, without text 10, clearly misses a verse near 02.0039, by which we know (see 'rhyming pares' criterion a) that this group contains unoriginal readings. Group 09-10- has a clear violation of rhyme (see criterion a as well) near 02.0045. Therefore, we can combine groups 09-11-12-13-14 and 09-10 with the larger unoriginal group 09-10-11-12-13-14-, which is in accordance with the 02.0261 formula.

Figure 92. *Lanseloet* verses 02.0259 to 02.0262: texts 09-10-11-12-13-14- have the same non-rhyming word 'komen', which seems to be unoriginal; only in text 01 the first word of the new clause rhymes with the previous clause, which is also noticed by Leendertz (1907:XXII), who says that verse '265' (our 01.0259) is original.

(Notice that the '@'-sign in front of 'Lanseloet [266]' (near the top of fig. 92) represents a paragraph sign; when '@' is present in the verse number, like in '01=>@', it denotes a 'computer-detected hole' (in text 01).)

Other formulas demonstrate that texts 06-07-08-, 04-05- and (04-)05-06-07-08- (probably) have unoriginal variants too:

```
02.0124    ?obs02: conventions pure rhyme violated in pair (~min -
                   ~hir) of texts 06-07-08- (near 02.124);T2?;9a

14=>*

Figure 94. *Lanseloet* verses 02.0739 and 02.0740: texts 04-05- have the same rhyming word twice; this violation of rhyme shows that texts 04-05- possibly contain unoriginal variants.

The 02.0526 formula tells us that texts 05-06-07-08- might be in an unoriginal area of the chain, because the rhyme is violated in these texts. The verses concerned are presented in fig. 95:

Figure 95. *Lanseloet* verses 02.0526 to 02.0529: texts 05-06-07-08- have non-rhyming verses, which indicates that these texts (probably) contain unoriginal variants.

We already knew (see figs. 93 and 94) that 06-07-08- and 04-05- were unoriginal areas. Fig. 95 and the 02.0526 formula show that 05-06-07-08- are unoriginal too. Therefore, we can combine the two areas of 04-05- and 06-07-08- into one larger unoriginal area 04-05-06-07-08-. In the two shaded chain areas in fig. 96, we illustrate our conclusion that texts 04-05-06-07-08- and 09-10-11-12-13-14- (see fig. 92) possibly show unoriginalities.

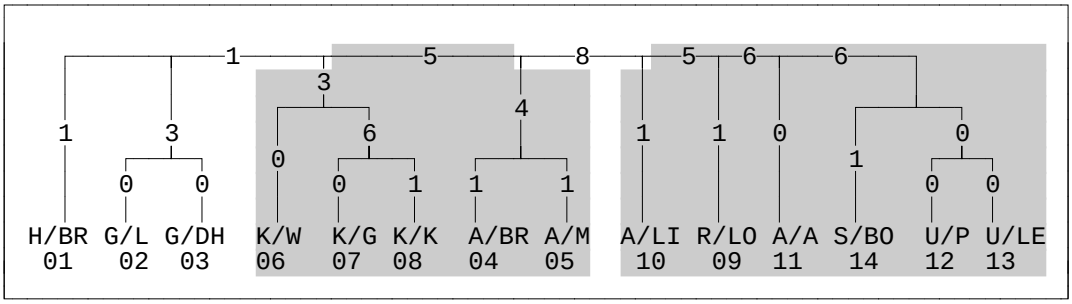

Figure 96. Unoriginal (shaded) areas in the chain of *Lanseloet van Denemerken* so far.

There is a gap between the areas of the texts 04-05-06-07-08- and 09-10-11-12-13-14-. We must investigate whether this gap contains unoriginal variants that occur in both areas. If so, we can connect both areas into one unoriginal area. Therefore, we have to find unoriginal variants in texts that belong to both sides. We find in Appendix D three formulas that indicate what we are looking for:

```
02.0270 08 ^comb.: 05-10-|02-09-11-12-13-14-="opersten"|"opperste"
                   (<:2ch; fin-n;7a;6a)
02.0582 11 ^treat: 3ch.wrd "sit" in 05-09-10-11-12-13- (rest:
                   01-02-06-07-08-); (^:small word?);11a?
02.0582 11 ^treat: 2ch.wrd "hi" (Pn) in 05-09-10-11-12-13- (rest:
                   01-02-06-07-08-); (^:small word?);11a?
```

First, the word ‘opersten’ in texts 05 and 10 of the 02.0270 verses is a small error. The correct word will have been ‘oppersten’ (in English: ‘highest’). Following the evident error criterion c, we say that the area covering both texts could be unoriginal. Admittedly, this is not an optimally convincing example.

Second, texts 05-09-10-11-12-13- have ‘seit/seyd hij/hy’ in the 02.0582 verses. These words, to which both 02.0582 formulas refer, do not make much sense, as we can see in fig. 97. According to text 01, Reinout asks lord (‘heere’) Lanseloet: ‘what is the matter?’ (‘wat is dit dinck’). In texts 05-09-10-11-12-13-, the element ‘he said’ (‘seyt hy’) is added: ‘o lord, he said, what is the matter?’. ‘He said’ (or ‘Reinout said’) is clearly incorrect. (Clearly incorrect is perhaps too strong: all our judgements are hypotheses.) Therefore, according to criterion d, it is likely that the texts with ‘he said’ show unoriginal variants.

02.581 Reynout [529] 01.598 @ Reinout [544] 05.589 Reynout 06.591 @ Reynon 07.590 Reynont 08.590 Reynont 09.586 Reynout 10.594 Reynout. 11.598 Reynout. 12.596 Reynout. 13.596 Reynout.	02.582 O heere wat is dit dinck [529] 01.599 @ O edel here wat sijn die dinc [544] 05.590 @ O heere seyt hij wat es dat dinck 06.592 O heere wat is die saich 07.591 O here wat is die sach. 08.591 O here wat is die sach 09.587 O Heere seyt hy/ wat is dat dinc/ 10.595 O Heer seyt hy was is dat dinck 11.599 O Heer seyt hy wat is dat dinck 12.597 O Heer seyd hy wat is dat dinck/ 13.597 O Heer seyd hy wat is dat dinck/
02.583 Daer ghi aldus me sijt belast (+) [fo.C1r][530] 01.600 Daer ghi al dus o(m)me staet en claght (+) [545] 05.591 Daer ghij sijt aldus mede belast 06.593 Daer yr aldus mede sijt belast 07.592 Daer ir aldns mede syt belast 08.592 Dair yr alsus mit syt belast 09.588 Daer ghy aldus zyt mede belast. 10.596 Daer ghy aldus zijt mede belast. 11.600 Daer ghy aldus zijt mede belast. 12.598 Daer ghy aldus zijt mede belast. 13.598 Daer gy aldus zijt mede belast.	02.584 Lantsloet [531] 01.601 @ lanseloet [546] 05.592 [Lansloot] 06.594 @ Lansloot. 07.593 Lansloot 08.593 Lanslot 09.589 Lanslot. 10.597 Lantslot. 11.601 Lanslot. 12.599 Lanslot. 13.599 Lanslot.

Figure 97. *Lanseloet* verses 02.0581 to 02.0584: the element ‘seyt hi’ in texts 05-06-07-08- does not make sense and is, therefore, probably unoriginal. (The verses of the fragmentary texts 03, 04 and 14 are not delivered; these texts are not displayed in this figure.)

We can expand fig. 96 into fig. 98. The point of orientation is somewhere in the neighbourhood of text 01, 02 and 03.

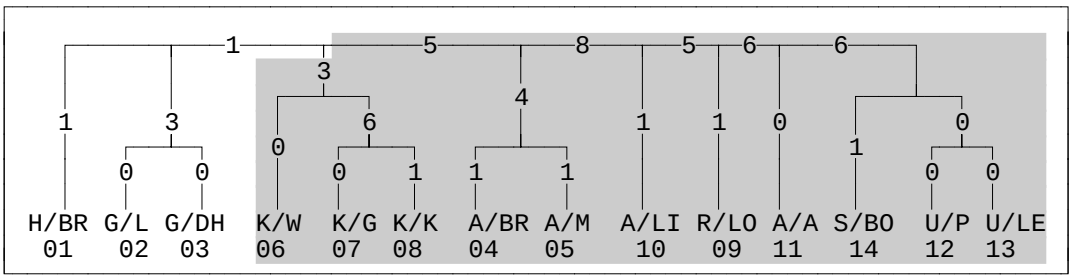

Figure 98. Expanded unoriginal (shaded) areas in the chain of *Lanseloet van Denemerken*.

Now, we concentrate on the remaining original area with the texts H/BR=01, G/L=02 and G/DH=03. As we discussed in §4.2 and §4.7.3, only a few verses of text (G/DH=)03 are delivered. For the process of orienting the chain into the stemma, we consider text 03 to be the same as text 02 (as we discussed on pp. 158-162). In other words, we act as if text 03 does not exist.

We must investigate whether text 01 and text 02 have unoriginal variants. First, we look at text 01. In the 02.0658 verses, pictured in fig. 99, text 01 gives us information about the desperate state Lanseloet is in after Sandrijn left him: (01.0680:) ‘Because all his heart and his complaint’ (01.0681:) ‘is that he has lost her (thus)’. ‘His heart (...) is that he has lost her’ is clearly incorrect, and, therefore, does not offer the original verses. The contents of the other text versions is more logical: ‘Because all his heart(’s) complaint is that he has lost

her'. Our conclusion is that text 01 possibly has unoriginal elements, a claim which is supported by Leendertz (1907).[145]

02.658 Want al sijns herten beclach [600]	02.659 Is dat hyse heeft verloren [601]
01.680 Want al sijn h(er)te en(de) sijn	01.681 Es dat hise dus heeft verloren [621]
(+) gheclach [620]	
05.667 Want al sijns herten beclach	05.668 Es dat hijse heeft verloren
06.669 Want al syns hertzen beclach	06.670 Is dat he se hait verloren
07.668 Want all syns hertzen beclach	07.669 Is dat he sie hait verloren
08.668 Want al syns hertzen beclach	08.669 Is dat he sie hait verloren
09.664 Want alle syn herten beklach	09.665 Is dat hyse heeft verloren/
10.672 Want alle zijns herten beclach	10.673 Is dat hyse heeft verloren
11.676 Want alle zijn herten beclach/	11.677 Is dat hyse heeft verlooren
12.674 Want alle sijn herten beklach/	12.675 Is dat hyse heeft verloren/
13.674 Want alle sijn herten beklacht/	13.675 Is dat hyse heeft verloren/

Figure 99. *Lanseloet* verses 02.0658 and 02.0659: the element 'sijn h(er)te en(de) sijn gheclach' in text 01 is probably unoriginal, which is also claimed by Leendertz (1907:XXV). (The verses of fragmentary texts 03, 04 and 14 are not delivered; these three texts are not displayed in this figure.)

When we study the variation formulas in §11.2.1.2 in Appendix D, Empty Verses in Type-1 Environment, we see that text 01 has many empty verses. However, often it is difficult to judge whether these empty verses are original or not. In the next section, §4.8.2.2 (see figs. 107 and 108), we will illustrate the unoriginality of text 01 with other examples.

Now, we will examine text 02. In Appendix D, we find many formulas that demonstrate that text 02 may contain derived, unoriginal variants. Amongst them are the following verses:

---

[145] Leendertz (1907:XXIV-XXV) concludes that text H, our H/BR=01, almost always has the best text, and that the other *Lanseloet* texts seldom have better readings. He mentions that H-verses 99, 388, 415 and 433 and *probably* H-verses 85, and 683, are not as good or as original as the other texts. I agree with Leendertz that in verses 90 (our 02.0067, pictured in fig. 107), 433 (= our 02.0452, pictured in fig. 108), and 620 (= our 02.0658, pictured in fig. 99) text H(/BR=01) has unoriginal variants. I am not convinced that the other H-verses mentioned by Leendertz are unoriginal, because the differences between this text and the other *Lanseloet* texts are very small. I present these other verses below, together with the competitive verses of text G/L=02:

```
02.62 Al dedi oec die wille mijn [51]
01.98 Al dadi den wille mijn [85]
--
02.77  Nochtans soe woudic houden mijn eer [65]
01.113 Nochtan woudic behouden e(m)m(er)meer [99]

```

Let us concentrate on the 02.0159 formula.[146] In the 02.0159 verses Lanseloet's mother speaks to Lanseloet. The verses are pictured in fig. 100.

02.159 Ick heb v wel horen vryen [141]	(02)
01.199 Ic hebbe v herde wel hore(n) vrien [179]	01.200 Lanseloet bider maghet marien [180]
05.159 Ick heb v wel hooren vryen	05.160 Dat seg ic v bider maghet marien
06.160 Ich hebbe vch wael horen vrijn	06.161 Dat seggh ich vch by sinte marien
07.160 Ich hebbe vch wael horen vrijn	07.161 Dat segghe ich vch by sente marien
08.160 Ich hebbe vch wail hoeren vryen	08.161 Dat segge ich vch by sente marien
09.157 Ic hebbe u een wijle hooren vryen/	09.158 Dat segghe ic u byder Maghet Marien
10.164 Ick hebbe u een wijle hooren vrijen/	10.165 Dat segghe ick u byder maghet Marijen
11.166 Ick hebbe u een wijle hooren vryen	11.167 Dat segge ick u by der Maget Marie:
12.165 Hebbe ick u een wijle horen vryen/	12.166 Dat segge ick u by der Maget Marie:
13.165 Hebbe ick u een wijle horen vryen/	13.166 Dat segge ick u by der Maget Marie:
02.160 Het gheuet mij wonder bouen maten [142]	02.161 Dat ghi v aldus qualic gaet saten (+) [143]
01.201 Dat en can mj verwonderen niet [181]	01.202 Dat ghi v seluen niet bat en besiet (+) [182]
05.161 Het gheeft mi wonder bouen maten	05.162 Dat ghi v dus qualijken gaet saten
06.162 Het gheeft myr wonder bouen maten	06.163 Dat yr vch aldus qualic gaet saten
07.162 Ydt gheft myr wonder bouen maten	07.163 Dat yr vch aldus qualick gaet saten
08.162 Idt hait myr wonder bouen maissen	08.163 Dat yr vch aldus qualich gaet saten
09.159 Het gheef my wonder boven maten/	09.160 Dat ghy u aldus qualijc gaet laten
10.166 Het gheeft my wonder bouen maten/	10.167 Dat ghy aldus qualijck gaet laten
11.168 Het geeft my wonder boven maten/	11.169 Dat ghy u aldus qualijck gaet laten/
12.167 Het geeft my wonder boven maten/	12.168 Dat ghy u aldus qualick gaet laten/
13.167 Het geeft my wander boven maten/	13.168 Dat gy u aldus qualick gaet laten/

Figure 100. *Lanseloet* verses 02.0159 to 02.0161: in text 02 a complete verse is missing, which is probably unoriginal, because the rhyme is broken. (The verses of fragmentary texts 03, 04 and 14 were not delivered; these three texts are not displayed in this figure.)

In the 02.0159 verses, a break in the rhyme scheme occurs; text 02 lacks a verse that rhymes with the following verse ending with 'marien'. Logically, according to criterion a, text 02 cannot be the original text. Analogously, in the 02.0462 verses, text 02 shows another unoriginal break in the rhyme scheme.

We conclude that texts 01 and 02 (and 03) may contain unoriginal elements. This is pictured in fig. 101.

[146] Notice that the 02.0159 formula tells us that ten texts have two or more verses, while the base text 02 has a single verse. Generally, the software treats the base text as a perfect text. If the base text shows a single verse, where the other texts show two or more lines, the software says that the other texts have extra verses, when compared with the base text.

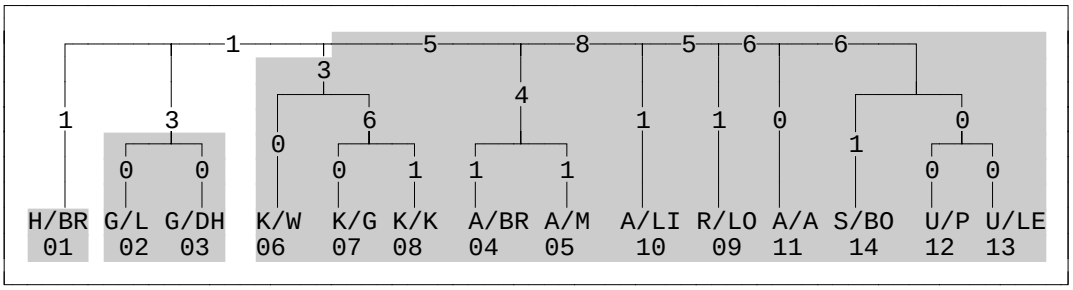

Figure 101. Further expanded unoriginal (shaded) areas in the chain of *Lanseloet van Denemerken*: texts 01 and 02 (and 03) cannot be in the original area.

We have almost determined the point of orientation. Suppose that we can find a variation formula in which text 01 has the original reading and the other texts are unoriginal. Then, the lost original must lie between text 01 and the other texts. Such formula can be found in Appendix D, §9.1.2.2.2:

```
02.0491    ?obs01: conventions pure rhyme violated in pair (~slip -
                   ~rit) of texts 02-05-06-07-08-09-10- (near
                   02.491);T2?;9a
```

The rhyming pair in text 01, ‘sliep’ - ‘riep’ (in English: ‘slept’ - ‘shouted’/ ‘called’), is better than the non-rhyming pair ‘sliep’ - ‘riet’ (‘riet’ = ‘adviced’) in text 02. When we assume that the lost original text had a perfect rhyme scheme, a matter which actually deserves further study, it is likely that ‘riep’ in text 01 is the original reading. Fig. 102 displays the verses.

02.486 O scone ioncfrouwe dat hoer ic gheerne (+) [439]	02.487 Dat ghi vanden scilde sijt gheboren (+) [440]

Figure 102. *Lanseloet* verses 02.0486 to 02.0493: we agree with Leendertz (1907:XXIII) that verses 01.0514 and 01.0515 are probably original and that the interpolation of verses like 02.0488 and 02.0490 was necessary because the original 'geboren sijt' was changed into 'sijt geboren', which violates the rhyme scheme. (The verses of the fragmentary texts 03, 04 and 14 are not delivered and not displayed in this figure.)

I suppose that the following happened. During the transmission process a copyist changed the word 'riep' to 'riet'. This was caused by an unintentional reading error. It is also possible that this was an intended change, because a copyist preferred an 'advising' angel to a 'shouting' angel. Intended or not, the change of 'riep' into 'riet' caused an imperfect rhyme. This imperfect rhyme survived a long time, but, after a while, a copyist restored the original rhyme scheme. The alteration of 'riep' to 'riet' and 'riep' is pictured in fig. 103. Notice that node 'x' right above texts 02 and 03 belongs to the unoriginal 'riet' area.

Figure 103. The distribution of the variants 'riep' and 'riet' (verse 02.0491).

Since we already know that the area from texts 11 to 14 contains unoriginal variants, we may conclude from the combination of figs. 101 and 103 that the original text - and, therefore, the point of orientation - must lie between text 01 and the other texts.[147] This is pictured in fig. 104.

[147] Other examples, which will not be discussed here, lead to the same conclusions. They can be found in Appendix D, in §9.1.2.2.2 and in §10.2:

```
02.0050    ?obs01: conventions pure rhyme violated in pair (~gesgin - ~si)

01 02 03 06 07 08 04 05 10 09 11 14 12 13

Figure 104. The point of orientation in the chain of *Lanseloet van Denemerken* is detected: it must lie between text 01 and all the other texts.

Suppose now, that the judgement of the originality of ‘riep’ is incorrect, and that, on the contrary, ‘riet’ is the most original reading. An argument for that point of view could be the Lachmannian principle of the *lectio difficilior*. According to this principle (see note 16), the variant which is more difficult to understand is the original variant. I think, but cannot prove it (the judgement is uncontrolable!), that ‘riet’ is the difficult reading. Then, the ‘riet’ area in fig. 103 is the original area, and the area with ‘riep’ the unoriginal. It seems, however, that this does not affect the point of orientation, because it still has to lie between texts 01 and 02.

In fig. 104, the point of orientation lies on the branch above text 01. We know from §4.8.2.1 that text 01 has unoriginal variants, by which it cannot be the original text with strictly original variants. In other words, we know that text 01 cannot be equal to the point of orientation.

Can the point of orientation be equal to the first node to the right of it, in figs. 103 and 104 (temporary) marked as ‘x’? If so, this would imply for the stemma that three branches sprout from the point of orientation (= the archetypus) in the stemma; these three branches would be the 01 branch, the 02-03 branch and the branch with the remaining texts. When we discussed fig. 103, we saw that we believe that node ‘x’ belongs to the unoriginal ‘riep’ area. Then, ‘x’ cannot be the point of orientation. If we think that ‘riep’ is the original reading, node ‘x’ belongs to the original area as well. Then, theoretically speaking, node ‘x’ can be equal to the point of orientation. This implies that the distance between the point of orientation and ‘x’ in fig. 104 is zero and that node ‘x’ becomes the point of orientation, by which in the stemma three branches would sprout from the archetypus text at the top of the stemma. However, at the end of §3.2.2, we saw that our default attitude does not stimulate but prevents the collapsing of zero length branches; we can only consider the collapsing if striking (non-textual) historical reasons are present. Therefore, we still assume that the branch part between the point of orientation and node ‘x’ cannot be collapsed and that fig. 104 is correct.

```

4.8.2.2. Second Attempt to Find the Point of Orientation

The first attempt to find the point of orientation, presented in the previous section, can be characterized as a rough and laborious search. With the help of our criteria, presented at the start of §4.8.2.1, we detected small unoriginal areas and combined them to make larger unoriginal areas. Finally, we concluded that the point of orientation lies close to text H/BR=01.

There is a second, far easier way to determine the point of orientation. All we have to do is to make a plausible case for the following claims: a. text H/BR=01 has original variants, while all the other texts have unoriginal variants; b. text H/BR=01 has unoriginal variants, while all the other texts have original variants. If we have made the case, we have shown that the point of orientation must lie between text H/BR=01 and the other texts. The first claim has already been demonstrated by figs. 92 and 102; this fact that H/BR=01 has original variants, while the other texts have unoriginal variants is also shown in figs. 105 and 106.

Figure 105. *Lanseloet* verses 02.0070 to 02.0075: 'original' criterion b is fulfilled only in text 01; criterion b is that the first verse of a clause rhymes with the last verse of the preceding clause; for that reason Leendertz (1907:XXII) is also convinced that verse '94' (our 01.0108) is more original than the comparable verses in the other texts.

In fig. 105, we see that only text H/BR=01 is in accordance with criterion b, which tells us that under normal (original) conditions the first verse of a clause must rhyme with the last verse of the preceding clause. The same is true for text H/BR=01 in fig. 106:

Figure 106. *Lanseloet* verses 02.0258 to 02.0263: again only text 01 fulfils criterion b, with the first verse of a clause rhyming with the last verse of the preceding clause; for that reason Leendertz (1907:XXII) is also convinced that verse ‘265’ (our 01.0295) is more original than the comparable verses in the other texts.

It is far more difficult to find convincing examples that show the unoriginality of text H/BR=01. We agree with Leendertz (1907:XXIV-XXV), who says that in most cases text H/BR=01 is more original or ‘better’ than all the other texts. Leendertz (1907:XXIV-XXV) states further that the variants of the other texts are possibly more original than the H/BR=01 variants only in a very few cases. Duinhoven (1977) is convinced that H/BR=01 contains many unoriginal elements. Notice, however, that Duinhoven’s judgements on originality are different from the judgments we are looking for. Duinhoven immediately starts with the *emendatio* phase, without preceding *recensio* phase. He simply treats H/BR=01 as the archetypus text, which has to be emended or restored into the lost original text.

The first possible unoriginality in H/BR=01 was demonstrated in fig. 99. The second indication of the unoriginality of text 01 can be found in verse 01.0103, presented in fig. 107. There, Lanseloet says to Sanderijn '(please) be gracious to me and stay faithful'. All the other texts have about the same verse, except for the verb 'stay' ('blijft'). It is likely that the verb 'stay' is unoriginal, because it does not make much sense here, as is confirmed by Leendertz (1907:XXV).

02.66 Ghi moecht noch worden mijn vrouwe [55]	02.67 Sijt mijns ghenadich en(de) ghetrouwe [56]

12.72 Gy mocht noch worden mijn Vrouwe/	12.73 Zijt mijns genadig ende getrouwe/
13.72 Gy mocht noch worden mijn Vrouwe/	13.73 Zijt mijns genadig ende getrouwe/
03=>*	03=>*
04.68 <G>hi moecht noch werden mijn vrouwe	04.69 <Si>jt mijns ghenadich ende ghetrouwe
14.60 ghij mocht noch worden mijn vrouwe	14.61 sijt mij genadich en getrouwe

Figure 107. *Lanseloet* verses 02.0066 and 02.0067: text 01 mentions 'blijft getrouwe' (= stay faithful); the word 'blijft' does not make much sense and seems to be unoriginal, as is confirmed by Leendertz (1907:XXV).

The third example to demonstrate the unoriginality of text H/BR=01 can be found in fig. 108. The Knight thanks God for the fortunate coincidence ('danc ic gode der auonture') that he got up in the morning ('dat ic heden merghen op stoet'). It is a peculiar that someone thanks God because he simply got up in the morning. In all the other texts the Knight thanks God because he got up early ('vroech') in the morning: if he would have risen later, he would never have met Sandrijn. Thanking God for the early rising in the morning makes much more sense. Therefore, we agree with Leendertz (1907:XXV) that text H/BR=01 is unoriginal here.

02.451 Ic danc gode der auentueren [408]	02.452 Dat ic huden soe vroech op stoet [409]
01.477 @ Noch danc ic gode der auonturen [432]	01.478 Dat ic heden merghen op stoet [433]

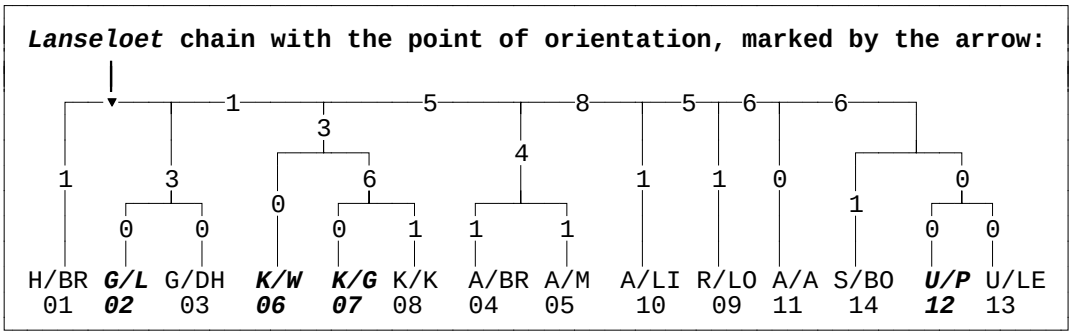
12.464 Ick dancke God der avontueren/	12.465 Dat ick huyden soo vroegh op stoet/
13.464 Ick dancke God der avontueren/	13.465 Dat ick huyden soo vroegh op stoet/
02.453 Ende ic soe scone ghemoet [410]	02.454 Vonden heb in mijnre iacht [411]
01.479 En(de) dat ic soe edelen scone ghemoet [434]	01.480 Vonden hebbe te mire jacht [435]
05.460 Ende dat ic also schonen ghemoet	05.461 Gheuonden hebbe tot mijnre iacht
06.461 Ind ich so schonen ghemoet	06.462 Vonden hebbe in mynre iacht
07.460 Ind ich so schonen ghemoet	07.461 Vonden hebbe in minre iacht
08.460 Ind ich so schonen gemoet	08.461 Vonden haue in mynre jacht.
09.457 Ende dat ic alsoo schoonen ghemoet	09.458 Ghevonden hebbe in mynder Iacht/
10.465 Ende dat ick soo schoonen ghemoet	10.466 Ghevonden hebbe in mijnder iacht
11.468 Ende dat ick alsoo schoonen gemoet	11.469 Ghevonden hebbe in mijner jacht/
12.466 Ende dat ick alsoo schoonen gemoet/	12.467 Gevonden hebbe in mijner jacht/
13.466 Ende dat ick alsoo schoonen gemoet/	13.467 Gevonden hebbe in mijner jacht/

Figure 108. *Lanseloet* verses 02.0451 to 02.0454: it is more likely that the Knight thanks God because he got up *early* ('vroech') in the morning than that he thanks God because he woke up in the morning. Leendertz (1907:XXV) is convinced that verse '433' (our 01.0478) of text H/BR=01 is unoriginal. (The verses of fragmentary texts 03, 04 and 14 are not delivered; these three texts are not displayed in this figure.)

My conclusion is that we have found what we were looking for. Text H/BR=01 may contain unoriginal variants (where all the other texts have original variants) and original variants (where all the other texts have unoriginal readings). Our second attempt to find the point of orientation confirms that it lies close in the neighbourhood of text H/BR=01, as pictured in fig. 104.

4.8.3. PRESENTATION OF THE STEMMA OF *LANSELOET VAN DENEMERKEN*

In fig. 104 we presented the chain with the point of orientation. This chain is repeated in fig. 109. In this figure we have written texts 02, 06, 07 and 12 in bold-italics, to denote their special status. As we saw in §4.7.3, only these four texts 'hang' on collapsable zero length branches; other branches may have a zero length too, but we saw in §4.7.3 that those branches may not be collapsed.



***Lanseloet* chain with the point of orientation, marked by the arrow:**
1 1 5 8 5 6 6
3 4
1 3 0 6 1 1 0 1 0
0 0 0 0 1 1 1 0 0
H/BR ***G/L*** G/DH ***K/W*** ***K/G*** K/K A/BR A/M A/LI R/LO A/A S/BO ***U/P*** U/LE

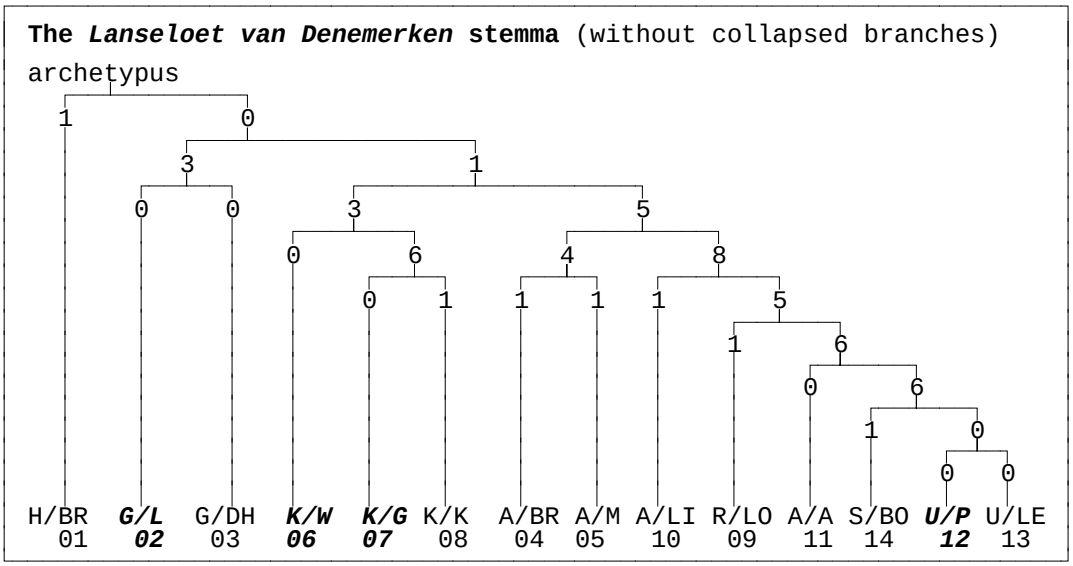
Figure 109. Adapted version of fig. 104: the *Lanseloet* chain, with the point of orientation.

Now we 'orient' the chain into the stemma. The stemma is pictured in fig. 110:



The *Lanseloet van Denemerken* stemma (without collapsed branches)
archetypus
1 0
3 1
0 0 3 5
0 6 4 8
0 1 1 1 1 5
1 6
0 6
1 0
0 0
H/BR ***G/L*** G/DH ***K/W*** ***K/G*** K/K A/BR A/M A/LI R/LO A/A S/BO ***U/P*** U/LE

Figure 110. The stemma of *Lanseloet van Denemerken*, without collapsed branches.

Finally, we apply the collapsing or contraction. This results in the (final) stemma of *Lanseloet van Denemerken* text versions, as presented in fig. 111. For presentational reasons, we have left out the denotations of the lengths of the branches in this final stemma.

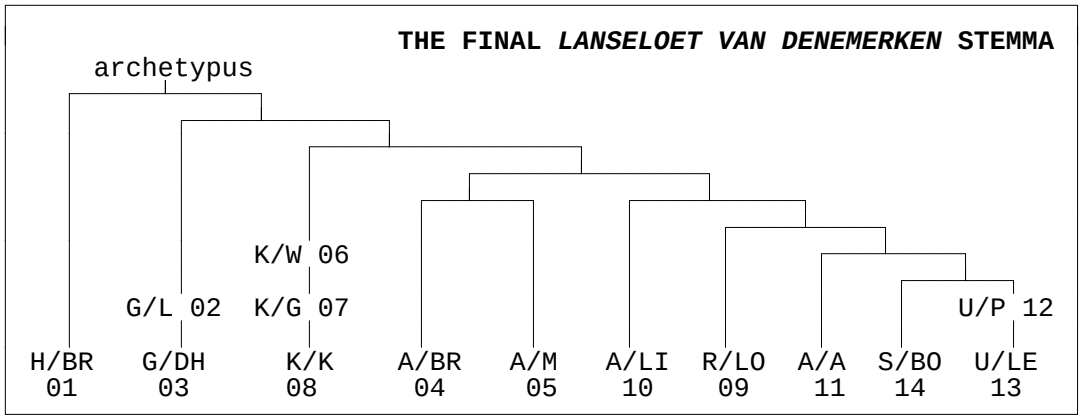

Figure 111. The final, definite stemma of *Lanseloet van Denemerken*.

4.9. INFORMATION DERIVED FROM THE *LANSELOET VAN DENEMERKEN* STEMMA AND TEXT VERSIONS

In §2.2, we discussed how a stemma can be used to reconstruct the lost original text or parts of it. This reconstruction process is performed in two steps.

During the first step, the *recensio*, the contents of the common ancestor, the *archetypus*, is (re)constructed. Original fragments present in the delivered texts are assembled and presented as the archetypus text. Often the stemma and (re)construction rules derived from it can help us to find the archetypus text fragments in the surviving text versions. In the case of the *Lanseloet van Denemerken* stemma, the rules are quite simple. Unfortunately, there is only one reconstruction rule: if a text fragment is present in text 01 and in one or more of the other texts, it must be a fragment of the archetypus text. ‘Unfortunately’, because the *Lanseloet* stemma does not have an ideal form for text reconstruction purposes, since the delivered texts are not nicely spread around the archetypus. Suppose, for example, that the point of orientation, and therefore the position of the archetypus, would have been between the group of texts 01-02-03-06-07-08- and the group 04-05-09-10-11-12-13-14-. In that case, we would have had many more reconstruction possibilities and rules. Then, if any text(s) belonging to the first group would have had a text fragment in common with any text(s) from the second group, we would have concluded that the fragment is part of the archetypus. Furthermore, when text 01 shows one variant and (all) other texts show another variant, the stemma cannot help us decide which variant belongs to the archetypus text.

Once the archetypus text is constructed, it can be considered as the best (artificial) copy of the original text we possess. However, the archetypus may contain unoriginal elements. This is clearly demonstrated by verses 02.0079 and 02.0080 in fig. 112. Both verses have the non-optimal rhyming pair ‘haven’-‘maghen’. This pair, which seems to be unoriginal due to its imperfection, must occur in the archetypus text, since it occurs in all the delivered text versions. During the second step of text reconstruction, the *emendatio*, these unoriginal elements are removed out of the archetypus text.

Figure 112. *Lanseloet* verses 02.0077 to 02.0082: it is remarkable the words ‘haven’ and ‘maghen’ do not rhyme optimal, while they occur in all the texts. (The verses of fragmentary texts 03 and 04 are not delivered; both texts are not displayed in this figure.)

This book deals with theoretical considerations concerning the development of chains and stemmas, the very first part of the *recensio*. It does not offer (re)constructions of the archetypus text or the original text of *Lanseloet van Denemerken*. I refer the interested reader, who wants to know more about the study of original or unoriginal readings and suggested emendations, to Beckers (1993).

A stemma can be important even for editors of diplomatic texts. Hüsken & Schaars (1985), for example, offer a good diplomatic edition of *Lanseloet van*

Denemerken text 14, the ’s-Gravenpolder text version. When necessary, they offer information and critical remarks in the footnotes. Hüsken & Schaars (1985:53) remark that the word ‘daen’ in verse 410 (in our edition numbered as 14.0304, near base text verse 02.0480) should be read as the verb ‘doen’. With the stemma and fig. 113 at hand, we see that the closely related texts 09, 11, 12 and 13 all have ‘dan’. Therefore, it is likely that ‘daen’ should be read as the adverb ‘dan’.

02.480 Soe sal ic v minen naem laten weten [434]	02.481 Sandrijn soe ben ic geheten [435]

03=>*	03=>*
04=>*	04=>*
14.304 soo sal ick u mijnen naem daen laten weten	14.305 sandrijn ben ick geheeten

Figure 113. *Lanseloet* verses 02.0480 and 02.0481: it is likely that ‘daen’ of text 14 should be read as the adverb ‘dan’, which occurs in the closely related texts 11 to 13.

For text-critical, emending editors, a stemma is important too. The philologist Duinhoven is one of the last Dutch text-critical editors who tries to emend unoriginal parts in texts. Often, he is criticized without sufficient grounds for his emendations. His opponents blame him for not respecting the existing texts and for making subjective, and therefore unscientific, judgements about incorrect elements in a text. Salemans & Wackers (1987) and Salemans & de Bonth (1990-91) state that Duinhoven could weaken the criticism of his ‘subjectivity’ by presenting his emendations after a thorough *recensio* process, in which the text-genealogical relationships of texts are studied and during which important differences between text versions are investigated. Duinhoven seldom uses the *recensio*. But if he does, he disregards the preferred sequence of *recensio before emendatio*. Often, he first observes an irregularity in a text. Then he emends it. Finally, he compares his emendation with the text in the other text versions.

The following is an example. In Duinhoven (1977:227-230), Duinhoven wrestles with verses 99 to 104 in text H/BR=01 (see fig. 112). He thinks or *feels* (philologically) that there is something wrong with these verses and that they cannot be original. His philological *experience* tells him that verse 101 (our verse 01.0115) is too long.[148] If Duinhoven would have studied the *Lanseloet* texts beforehand, he would have seen that this long verse is not present in the same form in text G/L=02. With the stemma at hand, so that he could see that text H/BR=01 is at one side of the lost original and text G/L=02 at the other, he could have observed in an objective way, without any ‘feelings’, that the texts have two different verses. The stemma dictates that one of these verses can be the (most)

[148] See also our note 116.

original verse. In other words, the stemma gives a undisputable objective reason for the necessity of emendation. Notice that the stemma does not express which of both verses are (closer to the) original.

Here is another example. Duinhoven (1977:208-210) expresses that verses 921-928 (in our edition verses 01.1010-01.1017)) are suspicious, because they express that *Lanseloet* is both sad and happy ('blidelike' in verse 925 or 01.1014). A simple observation during the *recensio* would have shown him that all the other texts have the variant 'oetmoedelik' (in several forms). The point is not to claim that the other *Lanseloet* texts offer here better or possibly more original, verses. I simply want to express that text G/L=02 and other texts clearly show that 'something is the matter' with the verses mentioned. No subjective feelings or interpretations are needed for this simple observation, which offers undisputable grounds for further research. Not all of Duinhoven's feelings can be founded by comparing the texts. However, parts of his judgements can be checked in an objective way.

In the past, text editors often considered the oldest text version of *Lanseloet van Denemerken*, text H/BR=01 in the 'manuscript Van Hulthem', to be the best text version. As we saw in §2.2, the oldest text does not necessarily resemble the lost original text better than other, younger text versions. However, their choice for text H/BR=01 can be partly justified with our stemma, because this text version is closely related to the archetypus text. On the other hand, the stemma teaches that other texts may contain original variants not present in text H/BR=01.

4.10. CONCLUSION AND SUMMARY

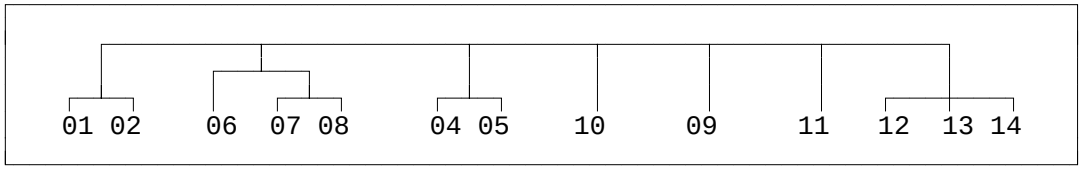
In the previous chapters, I described the text-genealogical principles; I formalized these principles into a (kind of) theory of recognizable characteristics of variants; and I implemented these characteristics into computer software, thus enabling the computer to perform the theory. In this fourth chapter, I described the results of running the computer application. The computer was able to build a text-genealogical tree of *Lanseloet van Denemerken*.

In §4.2, I made some bibliographical remarks concerning the fourteen *Lanseloet* text versions. It is claimed that bibliographical research and autopsy are necessary elements of text-genealogical research. I demonstrated in §4.3 how the software treated some of the *Lanseloet* verses.

In §4.4, the first computer results were discussed. The software detected 24 (potentially) good variation formulas concerning characteristics 5 and 7d. Furthermore, 239 other variation formulas were accepted by the automated text-genealogical characteristics. In §4.5, we examined these 239 formulas closely for two reasons. First, we are aware that the computer software might make some (small) errors. Second, the seventh text-genealogical principle says that a

philologist must decide whether the computer detected variation formulas are correct. The result of our critical, systematic, intersubjective (repeatable by others) examination was that we had to discard 206 variation formulas: 59 German/Dutch cases, 21 combinations of characteristics 6 and/or 7, 46 cases not incorporated in the thesaurus, 8 verb versus noun variants, 5 variation formulas concerning different variation places, 20 small differences between variants, not treated by the software yet and 47 special cases. This process of discarding the 206 variation formulas is described in detail in Appendix D, §12.2.1 to §12.2.7. In Appendix D, §12.2.8 the remaining 33 variation formulas are clustered into 21 formulas. Of course, I could have improved the software, which would have limited the number of 206 discardable variation formulas. I did not choose to do so, because I felt that such operation would have been too ad hoc. Furthermore, the result of the work by the computer was acceptable. The computer eventually tested 5758 formulas; only 239 passed the tests. Checking these 239 variation formulas was not a very complicated or tiresome task.

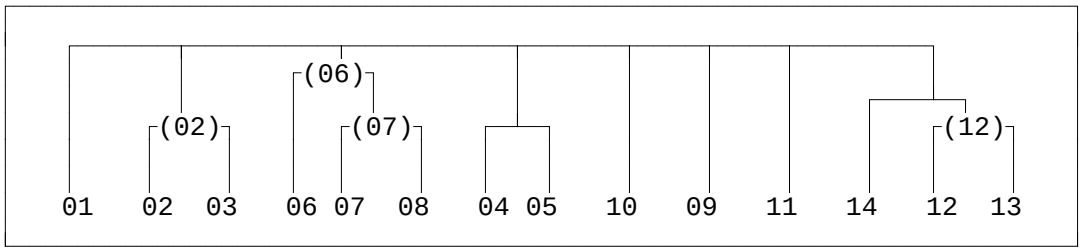
With the remaining 21 variation formulas plus the 24 other characteristic 5 and 7d formulas, it was possible to draw a first draft of the text-genealogical tree. We used our algorithm presented in fig. 12 to draw chains with. The first draft of the *Lanseloet* chain was presented in §4.7.1, in fig. 74:



(Figure 74.) First sketch of the *Lanseloet van Denemerken* chain.

In §4.7.2, we found that none of the 45 variation formulas contradicts the presented chain. In other words, there is no reason to assume that the *Lanseloet* texts suffered from contamination.

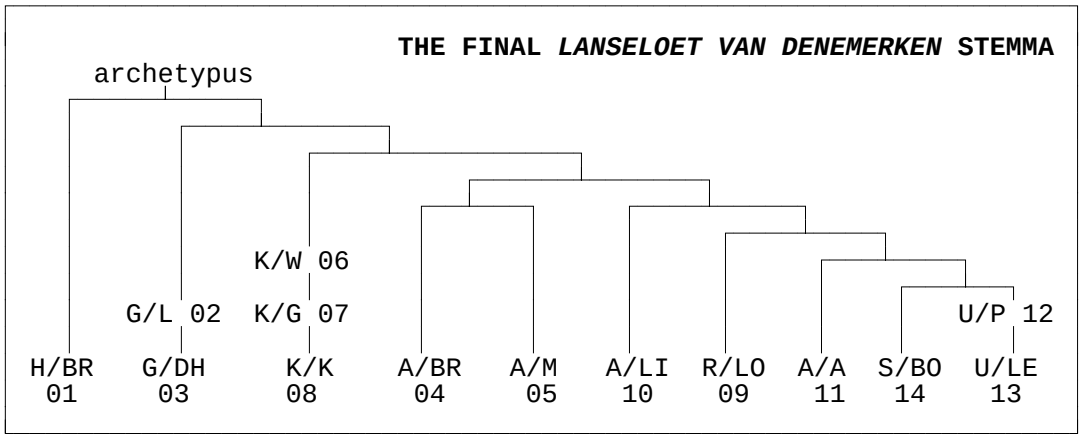
In the chain in fig. 74, texts 01 and 02 are equal, i.e. both texts do not show different variants in the 45 formulas. The same is true for texts 07-08-, texts 04-05- and texts 12-13-14-. To discriminate the differences between the mentioned texts, we studied type-1 variation formulas in §4.7.3. In such formulas, we have precisely two competitive variants; one variant is present in precisely one text, while the other variant occurs in the other texts. From these extra nine formulas, presented in fig. 84, we learned that texts 01, 04, 05, 08, 09, 10 and 14 each have unique (type-1) variants. They cannot be intermediate nodes in the chain, but texts 02, 06, 07 and 12 can. The newly found formulas and some considerations concerning text 11, enabled us to draw a more detailed chain, as presented in fig. 85:



(Figure 85.) Second, more refined, sketch of the *Lanseloet van Denemerken* chain.

Our algorithm (in fig. 12) for drawing handmade chains is rather simple and not automated. We can draw the chain as well with help from the cladistic software package PAUP, which is explained and demonstrated in §4.7.4. After we offered our 45 old and 9 new formulas to PAUP, it developed a chain which totally agrees with our handmade chain in fig. 85. Furthermore, the chain still has a maximum consistency: each variation formula is in agreement with it. We can, therefore, be fairly sure that the chain is correct. Or, in other words, there is not one good reason (in the shape of a text-genealogical variant) to assume that our chain is incorrect.

In order to develop a stemma from a chain, we need information about original and unoriginal areas in the chain. As explained in §4.8, this is quite a delicate operation, since a few variation formulas have to be judged (subjectively) as to their original and unoriginal areas. Without such judgements, it is simply impossible to develop a stemma from a chain. The study of a few variation formulas in §4.8 showed that the point of orientation must lie somewhere between text 01 and texts 02-03-. With this information, it is possible to draw the final version of the *Lanseloet van Denemerken* stemma, presented in fig. 111:



(Figure 111.) The final, definite stemma of *Lanseloet van Denemerken*.

I admit that, unfortunately, our search for the point of orientation on the chain of *Lanseloet van Denemerken* was difficult. Therefore, some people may doubt

whether the resulting *Lanseloet* stemma is correct. Of course, I am convinced that it is correct. However, I would like to stress here, that from a theoretical point of view the correctness of the stemma is not very problematic. For the evaluation of the theory - or better: the text-genealogical characteristics - in the next chapter, we do not need the *Lanseloet* stemma. We only need the *Lanseloet* chain for the evaluation.

5. EVALUATION OF THE *LANSELOET VAN DENEMERKEN* STEMMA AND THE TEXT-GENEALOGICAL CHARACTERISTICS

5.1. INTRODUCTION

In the previous chapter the chain and stemma of the fourteen *Lanseloet* texts were presented. In §4.7.4.3 we saw that the *Lanseloet* chain has an optimal consistency, because all the forty-five variation formulas are in agreement with it.

In the current chapter we will evaluate the stemma and the text-genealogical characteristics, with which the *Lanseloet* trees were produced.[149] First, in §5.2, we will compare our stemma with the *Lanseloet* stemmas (or parts of it) as produced by Leendertz (1907), Goossens (1973), Goossens (1976) and Hüsken & Schaars (1984). We will study their approaches and investigate whether our method of building the *Lanseloet* stemma needs to be adapted. We will also check whether our computer software has overseen certain variants.

Second, in §5.3, we will evaluate the quality of the text-genealogical characteristics. How will this evaluation be performed? In §3.3.1, eleven text-genealogical main characteristics were formulated and in §4.3 (and more detailed in Appendices A and B) was demonstrated how the computer was enabled to detect or work with them. We saw that, generally, three types of characteristics exist: 1. some characteristics are *positive*, in the sense that they admit or advice us to use certain variants for the development of the *Lanseloet* tree; 2. other characteristics are *negative*, in the sense that they forbid to use certain variants for tree-building purposes; 3. the remaining group of characteristics can be called *dubious* (like characteristic 8 on word order); we do not know whether a dubious characteristic is positive or negative. I stress that the characteristics have the status of hypotheses. They cannot be proved; it is only possible to falsify or confirm hypotheses, and later, check or test them in other environments. In chapter 4 it is described how the computer used the positive characteristics to build the *Lanseloet* tree with. The variation formulas, which were constructed by the computer from these positive characteristics, finally resulted in a trustworthy *Lanseloet* chain (see fig. 91). This chain has an optimal consistency (see §4.7.4.3). It is trustworthy, because all the 54 formulas point towards one and the same chain. We cannot find one formula that contradicts another formula or the chain. Therefore, the positive characteristics are confirmed; at least, they are not falsified. If our *Lanseloet* stemma is not in contradiction with previous stemmas, developed by other scholars (which will be discussed in §5.2), again we do not have any reason to assume that the positive characteristics or the *Lanseloet* tree are incorrect. Then we can look at the negative characteristics, which forbid to

---

[149] I note that the application of my characteristics is not completely new. In 1989 and 1991, I successfully applied an earlier version of the characteristics to seven versions of Chrétien de Troyes's *Yvain* (see: Salemans 1996).

use certain variants for text-genealogical, tree-building purposes. It is predicted that negative characteristics can lead to variation formulas which are in contradiction with the *Lanseloet* tree, which is presumed to be correct. If negative characteristics are confirmed (because they clearly are in disagreement with the tree), there is no good reason to believe that they are incorrect. We will also evaluate the dubious characteristics; we will try to find out whether they are positive or negative.

Suppose that the eleven characteristics are not falsified, but confirmed by the evaluation. Then it is not *proved* that they are correct. All we know that they lead to a good result in the case of the fourteen *Lanseloet van Denemerken* text versions. In the case of such a positive evaluation it is interesting to test how the characteristics behave when applied to other texts.

5.2. Evaluation of the *Lanseloet van Denemerken* Stemma by Comparing it with *Lanseloet* Stemmas in Other Studies

5.2.1. The Part of the *Lanseloet* Stemma in Leendertz (1907)

In Leendertz (1907:XXVII) the oldest stemma of the *Lanseloet van Denemerken* text versions is presented. It is offered here in fig. 114. The length of the branches in this figure are unified by me; Leendertz expressed with the lengths of the branches the age of the text versions; the shorter a branch is, the older and closer to the original the text version is. Our tree is reprinted in fig. 115. Leendertz's text versions H, G, A, Pl, K and K1 (which are all the versions he knew) are known to us as, respectively, H/BR(=01), G/L(=02), A/M(=05), A/A(=11), K/G(=07) and K/K(=08). Notice that the eight text versions 03, 04, 06, 09, 11, 12, 13 and 14 have been left out in our stemma, to make it better comparable with Leendertz's tree. Some of these removed texts (or the branches they sprout from) are replaced in our stemma in fig. 115 and other figures by three dots '...'.

When we compare Leendertz's stemma with ours, we see two small differences.

First, Leendertz uses a capital O ('Original'), while we use 'archetypus'. As explained in §2.2 and §2.3, we assume that, in the case of an *open deliverance*, a stemma offers an abstract view of the history of the deliverance of a text. On all the lines in the stemma, lost texts can be imagined. Leendertz is convinced that his *Lanseloet* stemma offers an exact, non-abstract, and more or less complete pattern of a *closed deliverance*. He assumes that there must have been precisely four lost texts: 1. the lost common ancestor of A and Pl; 2. of A, Pl, K and K1; 3. of G, A, Pl, K and K1; 4. the lost original. Provided that our stemma, printed in

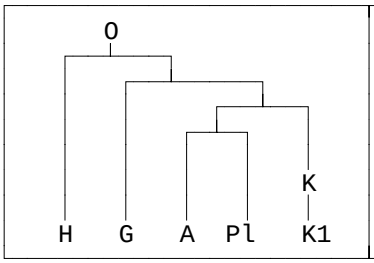


Fig. 114. Stemma by Leendertz (1907:72); his H is our H/BR=01; G is G/L=02; A is A/M=05; Pl is A/A=11; K is K/G=07; K1 is K/K=08.

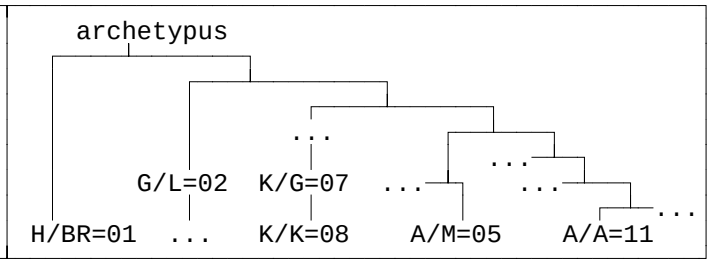

Fig. 115. Repetition of a part of our stemma (fig. 111); notice that many texts and lines of connection have been removed from our stemma, in order to make the comparison with Leendertz's stemma easier; the absences are denoted by '...'.

fig. 111, is correct, we know that between Leendertz's texts A and Pl (resp. our A/M=05 and A/A=11) many more lost texts can be imagined.

Second, we see that the Cologne branch, with K/G=07 (Leendertz's text K) and K/K=08 (= Leendertz's K1), is positioned in his stemma at the right side of the ancestral node, while the Antwerp branch, with A/M=05 (= Leendertz's A) and A/A=11 (= Leendertz's Pl), is at its left side. In our stemma, both branches are mirrored. The Antwerp branch is at the right, and the Cologne branch is at the left. When we discussed fig. 6, we saw that the left or right positions of branches which sprout from the same ancestral node are unimportant. Therefore, this second difference between both stemmas is trivial and can be ignored.

Apart from these small differences Leendertz's and our stemma totally agree. Leendertz develops his stemma in a different way. He creates it with the knowledge of the ages of the texts, and with (Lachmannian) common errors.

As far as the ages of the texts are concerned, we saw on page 16 that it is incorrect to assume that the oldest text version offers the most original readings. For Leendertz, the age of the text versions is crucial. He reasons in the case of *Lanseloet van Denemerken* as follows.[150] There are five texts, ranked in age, the oldest first, the youngest last: H, G, K1, K, A; this is the basic shape of the stemma. Taking the ages of the texts into consideration, according to Leendertz only H can be the prototype of the other texts. If H contains interpolations, gaps or unoriginal variants, we know that H cannot have been the original lost text. Then, it must have been derived from an older lost text (in this case the lost origi-

[150] Leendertz (1907:XXI): 'Wanneer wij onderzoeken willen, welke der ons overgeleverde teksten misschien den oorspronkelijken vorm heeft, dan moet in de eerste plaats op de ouderdom gelet worden. In volgorde van het jaar van vervaardiging hebben wij H, G, K1, K, A. Alleen H zou dus het prototype der anderen kunnen zijn. Het is nu de vraag, of H den oorspronkelijken vorm kan hebben. Daartoe moeten wij drie dingen nagaan, nl. 1. of er in H interpolaties zijn, 2. of er gapingen zijn, 3. of er verkeerde lezingen zijn, waarvoor wij de andere de ware lezing vinden.' Leendertz (1907:XXV): 'De uitslag van dit onderzoek is dus, dat H de beste redactie heeft, en nog zeer dicht bij het oorspronkelijke staat, maar niet de bron is van G A K.'

nal) without these unoriginal elements. If the number of the mentioned unoriginal elements is low, we know, according to Leendertz, that H and the lost original text are very much alike. In fact, Leendertz's procedure is: 1. the basis shape of the stemma is a vertical line; at the top of it is the oldest text version, at the bottom the youngest; on the line between both points the other texts are placed; 2. if a text version X or group of texts YZ have unoriginal elements where one or more younger text versions have original elements, we know that X or YZ cannot be part of the vertical line. This is enough proof,[151] according to Leendertz, to establish the existence of a lost text on that line, which is connected to X or YZ.

The problem with Leendertz's common error approach is the general problem with Lachmannian common errors, which we discussed in §2.3, §2.6.1 and §2.6.2: generally, it is hard to determine and to falsify whether a reading in a text version is original or derived. Goossens (1973) demonstrates that some of the errors Leendertz used for the development of his stemma are incorrect or dubious. Leendertz detected, for instance, that in text version G(/L=02) - in verse 02.0843, pictured in fig. 116 - the small pronoun 'v' ('you'), is missing while it is present in all the other texts. On the basis of this error in text G(/L=02), Leendertz concluded that G(/L=02) must have a separate position in the stemma. Goossens demonstrated that the absent word can easily be restored and, therefore, cannot be used for the development of the stemma.[152] It seems that Leendertz did not take

---

[151] Compare Leendertz (1907:XXV): 'Dat K ouder is dan A, is trouwens al genoeg bewijs, dat K niet naar A kan gemaakt zijn.' and Leendertz (1907:XXVII): 'Deze uitgave (Pl or our A/A=11; BS) moet dus bewerkt zijn naar een ouderen druk van Vorsterman, waarmede tevens het bestaan van zulk een druk wordt bewezen.'

[152] Goossens (1973:69): 'Leendertz' Hauptargument ist das Fehlen eines Wortes in einem Vers in G/L, das nicht nur in A/M und K/G, K/K, sondern auch in H vorkommt (H 788 *Metter waerheit seggen dat ic v sach*, ähnlich A/M 770, K/G 771, K/K 772; G/L *Mitter waerheyt segghen dat ic sach*). Dies is zwar ein wichtiges Indiz, aber an sich als Beweis nicht ausreichend: Nehmen wir an, dass G/L Vorlage von A/M und K/G gewesen ist, so kann ein Zwischenglied zwischen G/L und A-K (i.e. A/M, K/G and K/W; BS) oder können A/M und K/G unabhängig voneinander dat direkte Objekt *v, vch* wieder eingefügt haben, weil nur die Einfügung einen guten Sinn ergibt. Leendertz hebt dan noch drei weitere Verse hervor, in denen sich H zusammen mit K/G, K/K und A/M von G unterscheidet. In zwei vond diesen Fällen handelt es sich bei G/L um Entgleisungen im Reim (H 773/774 *van hoghen moede/rijc van goede*, ähnlich A/M 775/756, K/G 756/757, K/K 757/758; dagegen G/L 752/753 *van hoghen moede/ rijc van moede*; H 861/862 *gheloven dan/ hoghe geboren man*, ähnlich A/M 841/842, K/G 842/843, K/K 843/844, dagegen G/L *gheloven dan/ hoech gheboren heer*). Hier ergab sich der Reim von selbst, so dass er auf die gleiche Weise in A/M und K/G wiederhergestellt konnte. Im letzten Fall, der nicht einmal in Leendertz' eigenes Stemma passt, geht es um eine Stelle, an der offenbar vielfach gebastelt worden ist: H 851 *dat scone wijf*, A/M 833 *dat schone wijf*, K/G 834 *dat reyne wyf*, K/K 835 *dat reyne wijff*, G/L *dat reyne wijf*. Man muss diesen Vers mit dem folgenden verknüpfen, in dem es heisst: H 852 *haer edel lijf*, A/M 834 *haer ionghe lijf*, K/G 835 *yr reyne lijf*, K/K 836 *yr reyne lijff*, G/L 831 *haer scone lijf*.' Frankly speaking, I do not understand the precise consequences of the last two quoted sentences for the stemma. However, I agree with Goossens that the verses do not show that there is a family or group H, K/G, K/K and A/M which have text-genealogical variants in common that do not show up in G/L.

into consideration his own warning that we must be very careful in drawing conclusions based on a small amount of differences or agreements.[153]

Figure 116. Selected part of the output in Appendix C, *Lanseloet* verses 02.0833 - 02.0844: in verse 02.0843 the pronoun ‘u’ is missing, which can be reconstructed quite easily.

We could conclude that we cannot use Leendertz’s analysis of the deliverance of the *Lanseloet* texts, because he utilizes the ages of the texts and common errors as (incorrect) tools to build his stemma. But such an easy conclusion is too hasty. If a study contains errors, this does not imply that the whole study is incorrect.

I admire two elements in Leendertz’s study. First, his idea of developing the basis shape of the stemma with the help of the age of the texts is interesting. It resembles the development of a chain with the help of a transformation order. His idea would have been correct, if the deliverance would have been closed.

Second, his treatment of common errors is quite clear and can be checked or falsified (as Goossens did). Leendertz is aware of the problem of determining the originality of variants. In general, he does not work with (small) *Lanseloet* variants. He advices us to use larger units to create stemmas: common holes in texts and especially interpolated verses.[154] This advice agrees with our characteristics 11a and 11b (see §3.3.1).[155]

---

[153] Leendertz (1907:XXVI): ‘Hieruit blijkt tevens, hoe voorzichtig men moet zijn met het maken van gevolgtrekkingen uit de overeenkomst of het verschil in enkele woorden. Eerst wanneer er een groot aantal van die woorden is, kan daar iets uit blijken.’

[154] Leendertz (1907:XXVI): ‘Maar nog meer bewijskracht hebben gemeenschappelijke leemten en vooral invoegingen van geheele regels.’

[155] Actually, I consider the absence or interpolation of complete verses to be the most important building stones for textual trees. If I was asked to produce a text-genealogical tree of another text, I would first try to find missing/added verses and try to build a chain from them.

5.2.2. THE PART OF THE *LANSELOET* STEMMA IN GOOSSENS (1973)

Just like Leendertz, Goossens builds his stemmas in one step. Goossens's (1973: 72) is reprinted in fig. 117, and our tree is reprinted in fig. 118. Notice that the six text versions 06, 09, 10, 11, 12 and 14 have been left out of our stemma, to make it easier to compare it with Goossens's tree. It is unclear why Goossens did not use text A/A=11, known to Leendertz as 'Pl', in his tree.

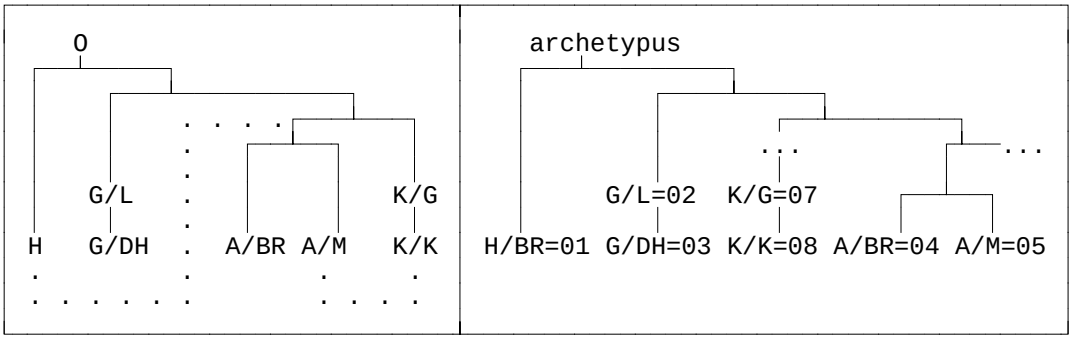

Fig. 117. Stemma by Goossens (1973:72). Fig. 118. Repetition of a part of our stemma; again the dots '...' point to the fact that some texts have been removed.

When we compare Goossens's stemma (1973:72) with ours, we see three differences. The first and second differences have been mentioned in §5.2.1, namely the use of an 'O' instead of 'archetypus'[156] and the irrelevant difference of the left and right positions of the Cologne and Antwerp branches. The third difference is eye-catching: the two dotted lines in the stemma of Goossens (see fig. 117).[157] According to Goossens, K/K=08 has K/G=07 and A/M=05, or a lost text that resembles A/M=05, as ancestors. This makes K/K=08 a contaminated text. The other dotted line expresses the influence of text H(/BR=01), or a lost text that resembles H, on the ancestor of the Antwerp text versions A/BR and A/M.

---

[156] I am not sure of how Goossens judged the historical value of his stemma, but I guess that he saw it as an exact picture of the text deliverance. Several times, he claims that K/K(=08) was printed or copied with text K/G(=07) as layer or source text, if I understand the German word 'Vorlage' correctly, for example in Goossens (1973:65): 'Dass der Schreiber von K/K seine Vorlage K/G modernisierend kopiert hat, wird schön von den Belegen für die Konjunktion 'und' illustriert.'

[157] Goossens (1973:72): 'Die gestrichelten Linien innerhalb des Stemmas deuten die Verbindungen von Druckfassungen mit ihren vermutlichen Sekundärquellen an. Letzere brauchen nicht unbedingt ins Stemma aufgenommene Texte zu sein; es kann sich auch um verlorene Versionen der Überlieferungsstränge handeln, denen H und A/M angehören.' Behind the final word 'angehören' Goossens (1973:72) gives his footnote 30: 'Das oben angeführte Material macht zwar die Annahme einer nl. Sekundärquelle für K/K plausibel, enthält aber keine besonderen Indizien für die Hypothese, dass diese Quelle dem Überlieferungsstrang A/M angehört. Ich stütze mich bei dieser Verbindung auf die Holzschnitte, die ich demnächst an anderer Stelle untersuchen werde.'

These dotted lines, indicating contamination, lead me to make a general remark about Goossens's and my method to build the *Lanseloet van Denemerken* stemma. The main difference between our methods is that Goossens uses many more variants as tree building elements. While we are confronted with an unfortunate shortage of text-genealogical variants, he considers almost every (non-spelling) variant as an indicator for a certain relationship. Goossens (1973:69-71) gives many examples of such variants, which we do not consider to be text-genealogical. He uses differences in word order ('sal costen' versus 'costen sal'), variants not belonging to the substantive or verb word classes ('den' versus 'die'), the absence or interpolation of small words like 'soe', differences in word endings ('god' versus 'gode'), and differences in language ('haers' versus 'yrs'). According to me, these variants carry the danger of parallelism.[158]

Goossens's criticism of Leendertz (see our note 152) demonstrates that Goossens is somehow aware of the danger of parallelism. He knows that when a simple but (almost) indispensable element, like a pronoun, is missing, this can be restored quite easily by copyists. Therefore, he states that the absence or presence of such an element in text versions does not offer trustworthy information for building a genealogical tree. Goossens says the same for violations of rhyme that can be easily repaired. Yet, he does not seem to be convinced that it is possible that copyists can, almost unpredictably, leave out, add or replace small, almost meaningless words like 'so', 'also', 'o', 'och' and even a pronoun like 'die'. It is, at the least, doubtful that such words have text-genealogical value. Our characteristic 11a warns for the parallelistic character of added or omitted small words.

In 1976, Goossens could have observed the text-genealogically dangerous character of small words by using his own observations in his publication of 1973. In 1973 - at the time he did not know that the oldest Cologne version K/W(=06) nor the 's-Gravenpolder text version S/BO(=14) existed - he observed that the small word 'die' was present in a verse of text version G(/L=02), while it was absent in the 'manuscript Van Hulthem' H(/BR=01), the Antwerp group A (= A/BR=04, A/M=05) and the Cologne group K (= K/G=07, K/K=08). Goossens (1973:71) stated: 'Danach ergeben sich neun Gegensätze G ≠ A - K: (...) 180 G/L *Die eedel minne die doet*, A - K + H *Die edel minne/lief(f)de doet/doit*; (...)' (see our fig. 119). Based on this and other observations, Goossens concluded in 1973 that text version G/L=02 cannot be a forefather of the Antwerp and Cologne texts. Then, in 1976, Goossens introduces text K/W(=06) in his stemma. Goossens (1976) does not mention that K/W(=06) has a verse in which 'die' (now in the form 'de') pops up again: 'Die edel liefde de doet haer werck'. If he would have

---

[158] In §5.3, I will evaluate whether or not word order (characteristic 8), variants not belonging to the substantive or verb word classes (characteristic 4b), interpolation or deletion of small words (characteristic 11a), word endings (characteristics 6a and 7a) and differences in languages or dialects (characteristic 7c) are parallelistic in the *Lanseloet van Denemerken* texts.

observed it, he would have had to introduce a new dotted line between H and K/W. The word ‘die’ appears as well in S/BO(=14): ‘die edele mine die doet haer werck’. In other words, ‘die’ (or ‘de’) is present in H/BR=01, K/W=06 and S/BO=14, and it is absent in the other ten texts. If we look at our stemma (see fig. 111), we see that a family group consisting of these three texts only, is highly unlikely, if not impossible. The conclusion is inevitable that the small word ‘die’ in this case can appear or vanish almost unpredictably in the texts. Therefore, it cannot be used for the development of a stemma - as Goossens did in 1973.

Figure 119. Output in Appendix C, *Lanseloet* verses 02.0203: Goossens (1973) uses the presence of ‘die’ in text 02 and the absence of it in texts 01, 04, 05, 07 and 08 to demonstrate that text 02 is not immediately related to these five texts; characteristic 11a says that the presence/asence of small words does not provide text-genealogical information.

Now, let us return to the real differences between Goossens’s and our stemmas, namely the dotted lines (see fig. 117). For the link between text H(/BR=01) and the ancestral node of A/BR(=04) and A/M(=05), Goossens uses four variants: 1. the presence or absence of the small word ‘so(e)’ (see fig. 120); 2. a variancy concerning the pronoun ‘ws/vs’ versus ‘v/euch/vch’ (see fig. 121); 3. a variancy concerning the adverb ‘Och’ versus ‘O’ (see fig. 122); 4. a variant concerning the article/pronoun ‘den’ versus ‘die’ (see fig. 123).[159] None of these variants,

[159] Goossens (1973) uses ‘G’ to denote the Gouda group with the texts ‘G/L(=02)’ and ‘G/DH(=03)’, ‘A’ for the Antwerp group with the texts ‘A/BR(=04)’ and ‘A/M(=05)’, ‘K’ for the Cologne group with, in 1973, the two texts ‘K/G(=07)’ and ‘K/K(=08)’, and ‘H’ for the ‘Manuscript Van Hulthem’ ‘H/BR(=01)’. Often, Goossens offers us Cologne variants accompanied by verse numbers. Because no edition with both texts is available, it is sometimes difficult to trace Goossens’s variants. However, everyone can easily find them with the search function of an editor or word processor. Furthermore, Goossens often mentions the accompanying variants and verse numbers occurring in the edition of our base text G/L(=02) by Hoffmann von Fallersleben (1837) (see Appendix B, §II.a, point j). These Hoffmann numbers are printed in my synoptic text edition (see Appendix C) at the end of the base text verses between brackets [].

The passage in which Goossens demonstrates the link between H and K can be found in Goossens (1973:70-71): ‘Im gleichen Ausschnitt (i.e. the first sixty verses; BS) gibt es aber auch vier

violating a.o. our characteristics 4 and 11, are proof for the relationship between H, A/BR and A/M. We will discuss this relationship again in §5.3.4.2.

Figure 121. Output in Appendix C, *Lanseloet* verses 02.0044: Goossens (1973) uses the agreement of the pronouns ‘vs’/‘ws’ (i.e. ‘us’/‘uus’) in texts 01, 04 and 05 as the second argument for the close relationship of these three texts; characteristic 4b warns us that it is dangerous to use a.o. pronouns for text-genealogical purposes.

Fälle mit einem Gegensatz A + H ≠ G - K: 7 A + H *menich spitich wo(e)rt/woort*, G - K *so(e) men(n)ich spitich wort*; 35 A + H *ws/vs niet gheweldich syn/zyn*, G - K *v/euch/vch niet g(h)eweldich(lich) sijn/syn*; 39 A + H *Och edel ridder*, G - K *O e(e)del ridder/ritter*; 51 A + H *den wille*, G - K *die wille*. (...) Um mit Sicherheit entscheiden zu können, ob eine brabantische Handschrift (H selbst?) für A als Sekundärquelle benutzt wurde, ist eine ausführlichere Untersuchung notwendig.’ With the last sentence, Goossens shows that he has doubts as to whether the four cases are enough to assume that there is a close relationship, expressed by the dotted line between H and A.

Figure 123. Output in Appendix C, *Lanseloet* verses 02.0062: Goossens (1973) uses the presence of the article 'den' in texts 01, 04 and 05 as the fourth argument to demonstrate that these three texts are closely related; characteristic 4b warns us that it is dangerous to use articles for text-genealogical purposes.

The other dotted line in fig. 117 suggests the (Dutch) influence of text version A/M(=05) on text version K/K(=08). Goossens tries to show this by offering us nine observed variants in K/K(=08) which do not occur in K/G(=07); he claims that these variants in K/K(=08) are of Dutch or Flemish origin.

The nine variants are presented here as couples of which the first word is the K/G(=07) variant and the second word(s) are the K/K(=08), H(/BR=01), G/L(=02), A/BR(=04) and A/M(=05) variants: 1. 'sunder' - 'sonder'; 2. 'onder' - 'under'; 3. 'vercaren' - 'vercoren'; 4. the missing of the pronoun 'ich' in

K/K(=08); 5. ‘ducki vil’ - ‘duck wijl’/‘dicwil(s)’; 6. ‘noit’ - ‘moit’/‘moet’; 7. ‘wars’ - ‘wat is’/‘wats’; 8. ‘cheder’ - ‘weder’; 9. ‘veste’ - ‘vast(e)’.[160]

We can arrange these variant couples into, in my vision, four parallelistic, uninformative categories of variance: a. (couples 1, 2, 3, 9:) differences in vowels as described by characteristic 7c; b. (couples 4, 6:) differences or omissions that can easily be repaired, falling under characteristic 6c or 11a; c. (couples 5, 8:) incorrect or dubious (or nonsense?) - and, therefore, unsteady - variants, ruled out by characteristic 6c and 11a as well; d. (couple 7:) other small differences, described by characteristics 6a, 7a and 7b. The first categorie concerns characteristic 7c, which claims that differences in vowels cannot be used as tree-building elements. This is in accordance with Ballard (1995), who demonstrates that it is not necessary that couples 1 and 2, with a difference between the vowels o and u, are caused by a Dutch or Flemish influence.[161] The second categorie concerns a.o. a hole in text 08 (see fig. 124), which is caused by the omission of the pronoun ‘ich’. This hole is so eye-catching, that it cries to be replaced by the missing pronoun. Near footnote 152, we discussed that Goossens criticized Leendertz, because Leendertz used a clearly absent pronoun ‘u’ or ‘uch’ as text-genealogical information to build (a part of) the *Lanseloet* stemma. On the same grounds we can criticize Goossens for his use of the clearly absent ‘ich’. The same is true for the variant ‘noit’, which does not make sense and can be easily replaced by the verb ‘moit’ of ‘moet’. The third categorie concerns the words ‘cheder’ (see fig. 125) in rhyming position and ‘ducki vil’ (see fig. 126). These variants are peculiar, if not to say nonsense, and can be replaced without too much effort by words like ‘weder’ and ‘duck wijl’.[162] The fourth categorie

---

[160] Goossens (1973:66): ‘73 K/G *sunder*, K/K *sonder* (H, G/L und A/M *sonder*); 77 K/G *Beneden onder*, K/K *Vnder*, (H *Op eerde onder*, aber G/L und A/M *Beneden onder*), 109 K/G *vtuerkaren*, K/K *vuissuerkoren* (H, G/L, A/M *wtuerkoren*); 165 K/G *Die wolde hain*, K/K *Die ich wolde hain* (H, G/L *Die ic woude hebben*, A/M *Die ick hebben woude*); 184 K/G *ducki vil*, K/K *duck wijl* (G/L *dicwil*, A/BR, A/M *dicwils*); 242 K/G *Dat syt niet quelic nemen en noit*, K/K *Dat sy niet quelich nemen en moit* (G/L *Dat sijt niet qualic nemen en moet*, ähnlich H, A/BR, A/M); 256 K/G *wars vch beghert*, 257 K/K *wat is vre begert* (H, G/L *wats v begheert*, A/BR, A/M *wats v begheren*); 285 K/G *sy daer uiet komt cheder*, 286 K/K *sy dair niet kompt weder* (G/L *si dan niet en comt weder*, A/M *sy niet en coemt weder*); 313 K/G *veste*, 314 K/K *vaste* (H *vaste*, G/L, A/M *vast*).’ Behind ‘*uiet*’ (in 285 K/G) Goossens (1973:66) gives his note 17: ‘Druckfehler für *niet*.’

[161] According to Ballard, text K/K=08 has the most Ripuarian features (see also footnote 133). In Ballard (1995) a.o. doublets of u/o, like ‘sonder/sunder’, are discussed. Ballard (1995:204): ‘(...) Dutch and Ripuarian have a similar phonetic lowering for WGmc. *u/o, and consequently the two dialects have a similar orthography for this vowel. Mediaeval Dutch is fairly consistent in rendering the lowering of this vowel with <o>. Ripuarian, although it has the same development, is not consistent with its spelling; variation between <u> and <o> is rampant, and doublets occur much more frequently in mediaeval Ripuarian than Dutch.’ This quotation teaches that we may not draw genealogical conclusions on the basis of the rampant spread of <u> or <o> in words.

[162] My promotor, Prof. Dr. G. Dibbets, had a nice suggestion: perhaps ‘ducki vil’ was derived from ‘duck .i. wil(e)’ or ‘duck .i. uuil(e)’ (in English: ‘often 1 time’).

covers the seventh couple ‘wars’ - ‘wats’ (see fig. 127). We can imagine that the K/G(=07) variant ‘wars’ can be turned into ‘wats’ without too much difficulty.

Figure 127. Output in Appendix C, *Lanseloet* verses 02.0287: Goossens (1973) uses the presence of ‘wars’ in text 07 to show that text 07 is not the immediate forefather of text 08, which has ‘wat is’; however, the difference between both variants is rather small.

In other words, the nine variant couples do not show that text K/K(=08) is influenced by a second Dutch or Flemish text. Goossens himself had doubts about the correctness of his observation. In his footnote 30, as quoted in our footnote 157, he admits that he does not have good evidence or support for his dotted line. However, Gossens promises that this will be shown in Goossens (1976).

Summarizing, the only real difference between both stemmas is that Goossens’s (1973) stemma has two dotted lines indicating contamination. Goossens does not offer convincing evidence to support these lines. The observation of contamination is probably caused by his use of incorrect, non-text-genealogical variants. In his research, Goossens focused mainly on variants in the first third part of the text. We fear that if Goossens would have concentrated on the final 700 verses as well, he would have found many more contradicting (in our view, incorrect) variants, resulting in more (incorrect) dotted lines, indicating contamination (‘Sekundarquellen’). Furthermore, the software did find and treat well all the variants mentioned in Goossens (1973) in accordance with the theoretical ideas.

5.2.3. THE PART OF THE *LANSELOET* STEMMA IN GOOSSENS (1976)

Goossens (1976)[163] offers the *Lanseloet* stemma as printed in fig. 128 and is the continuation of Goossens (1973). In §5.2.2, we saw that Goossens's (1973) stemma, printed in fig. 117, is the same as ours, except for the dotted lines.

If we compare Goossens's *Lanseloet* (1973) tree and our stemma, with the stemma in Goossens (1976), we see three differences: 1. the 1976 stemma contains the new, extra text K/W(=06), which is an ancestor of both younger Cologne texts K/G(=07) and K/K(=08); 2. in the 1976 tree, K/G(=07) is not an intermediate text anymore; 3. the 1976 stemma has one, instead of two, dotted lines; the dotted line between A/M(=05) and K/K(=08) has vanished.

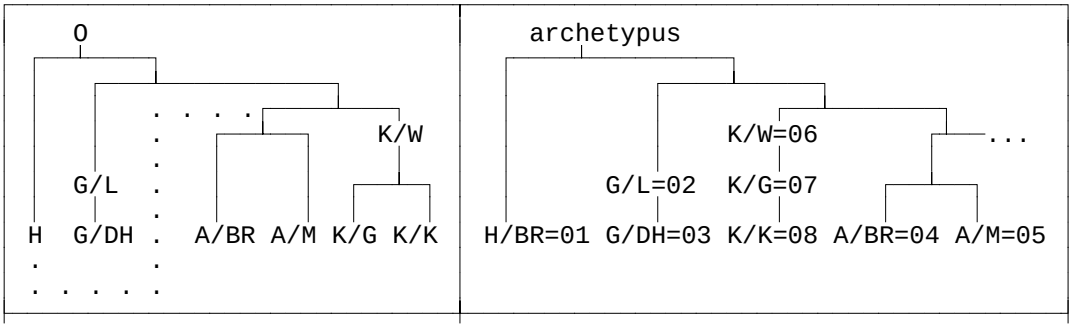

Fig. 128. Stemma by Goossens (1976). Fig. 129. Repetition of a part of our stemma.

Goossens established the Cologne branch, with texts K/W(=06), K/G(=07) and K/K(=08), using three sets of variants: 1. he demonstrates that K/W(=06) and K/G(=07) have many variants in common that do not occur in K/K(=08);[164] 2. he shows that K/G(=07) and K/K(=08) possess many variants that cannot be found in K/W(=06);[165] 3. he expresses that K/W(=06) and K/K(=08) share some

---

[163] The same stemma is also to be found in Goossens (1976b).

[164] Goossens (1976:217) expresses that several cases show that K/W=06 and K/G=07 have the same variants, while K/K=08 has a competitive variant: 'Einige Beispiele für den engen Zusammenhang von K/W und K/G gegen K/K aus den ersten hundert Versen: 15 K/W und K/G *harde saen* ≠ K/K *balde gayn*; 18 K/W *Daer so sal sy comen*, K/G *Dair soe sal sie comen* ≠ K/K *Dair sal sy komen*; 27 K/W und K/G *van niders tzonghen* ≠ K/K *van falschen tzongen*; 32 K/W und K/G *van uwer lielden* (sic) ≠ K/K *van vrer lieffden*; 47 K/W und K/G *Al waer di coninc* (K/G *wair dy koninck*) *ind crone spient* ≠ K/K *Al wair die koninck ind krone vch*; 69 K/W und K/G *Nochtan mey* (sic) *ich my also te* (K/G *tzo*) *huden* ≠ K/K *Nochtantz meyn ich mich also tzo huden*; 82 K/W und K/G *ontfarmen* ≠ K/K *vntbarmen*.' It was Goossens who put '(sic)' in this quotation twice. The use of the verse numbers is explained in our footnote 159. I must admit that I made a transcription error, which I did not notice even after ten rounds of collating: instead of 'lielden' I wrote 'liefden' (in texts K/W and K/G, near verse 32, i.e. near our base text verse 02.0041); this transcription error, still present, does not have any text-genealogical consequences.

[165] Goossens (1976:217) demonstrates that K/G=07 and K/K=08 have variants in common which do not show up in K/W=06: 'Im gleichen Ausschnitt (namely the first hundred verses; BS) gehen

variants that are not present in K/G(=07), although he immediately admits that these variants are not very important.[166] These three sets of variants do not sufficiently account for the shape of branch with the three Cologne texts as pictured in fig. 128. A common ancestor with three end branches each with a Cologne text sprouting from it would be in accordance with the three sets of variants as well.

We will shortly discuss the differences between Goossens's stemma (fig. 128) and our stemma (fig. 129). First, in our stemma the new text K/W(=06) is the ancestor of both younger texts K/G(=07) and K/K(=08) too. Notice that our variants demonstrated, as pictured in fig. 110, that there is a fair distance ('6')

---

andererseits K/G und K/K zusammen gegen K/W in: 13 K/W *joncfrauwe* ≠ K/G und K/K *junffrauwe*; 83 K/W *ontfaen* ≠ K/G und K/K *entfaen*; 84 K/W *Ind yr met myr* ≠ K/G und K/K *Ind mit mir* (K/K *myr*); 86 K/W *de vogelen machen gescal* ≠ K/G und K/K *de vogel en* (sic) *machen geschal*; 89 K/W *oec al sonder dorperheit* ≠ K/G und K/K *ouch sunder doerfferheit*; 90 K/W *tis dicke geseit* ≠ K/G und K/K *dit dicke gescheit*; 99 K/W *be rouwen* (sic für *betrouwen* in allen nl. Fassungen) ≠ K/G und K/K *berouwen*.'

Right behind this final word 'berouwen', Goossens gives his footnote 4: 'Die deutlichtsten Beispiele dieser Stufung finden sich nach v.235, wo K/W eine Zeile hat (*Al ist dat mynre hertzen deert*), die in allen nl. Fassungen vorkommt, aber in K/G und K/K fehlt, und nach v.248 (*Vnd verbeyden vp die kamer myn*), wo K/K eine Zeile hat, die in allen anderen Fassungen fehlt (*Dat niemant sal gayn dair jn*).' I do not understand this footnote. Indeed, the absence of verses in text K/G=07 and K/K=08 near v.235 (i.e. near our base verse 02.0264), gives both texts a special tie. But the occurrence of an extra verse in K/K(=08) near v.248 (i.e. near our base verse 02.0277) does not provide any information about the special relationship between texts K/G=07 and K/K=08, as Goossens seems to believe. This extra verse shows that it is likely that text version K/K=08 is and end note in the *Lanseloet* tree. By the way, the 'be(t)rouwen' variant is a nice *directional variant* (i.e. offering information about how the chain can be rooted or directed into a stemma). In text K/W=06 the printer introduced a space instead of the character 't' in the word 'betrouwen': 'be rouwen'. This space was then removed by a later printer, which lead to the new verb 'berouwen', only present in texts K/G=07 and K/K=08.

[166] Goossens (1976:218) states that occasionally K/W(=06) and K/K(=08) have variants in common, which do not occur in K/G(=07). He admits that these variants are not very trustworthy: 'Es gibt jedoch auch einige Fälle, wo K/W mit K/K gegen K/G zusammengeht, obwohl sie sicher weniger ins Gewicht fallen. In den ersten hundert Versen ist die Ernte sehr gering: 36 K/W *Het sel myr costen*, K/K *Idt sal myr kosten*, K/G *Het sal my costen*; 65 K/W *Nochtans*, K/K *Nochtann*, K/G *Nochdans*.' This is very poor evidence or support indeed; the differences are so small that they cannot have text-genealogical importance. Goossens continues with: 'Interessanter ist, dass in vier von den neun Fällen - und zwar in den überzeugendsten -, auf die ich mich in meinem vorigen Beitrag (see our footnote 160; BS) bei meiner Vermütung einer nl. Sekundarquelle für K/K gestützt habe, dieser Druck mit K/W zusammengeht: 109 K/K *vissuerkoren*, K/K *wtuercoren*, K/G *vtuerkaren*; 165 K/K *Die ich wolde hain*; 184 K/K *duck wijl*, K/W *ducwijl*, K/G *ducki vil*; 285 K/K *dat sy dair niet kompt weder*, K/W *dat sy daer neit comt weder*, K/G *dat sy daer komt cheder*. Da die Beweiskraft der fünf anderen Fälle, in den K/G mit K/W gegen K/K zusammengeht, sehr gering ist, möchte ich jetzt auf die Hypothese einer nl. Sekundarquelle für K/K verzichten (...)'. After the passage 'sehr gering ist', Goossens (1976:218) has a footnote: 'Als weiteres Argument habe ich im vorigen Aufsatz die Holzschnitte genannt, was ich jetzt aufgrund besserer Kenntnisse der Druckerzeichen aus der Zeit um 1500 glaube aufgeben zu müssen. Vgl. unten.'

between K/W and the other Cologne texts. Second, we see that in Goossens's stemma in 1976 K/G(=07) is not the forefather of K/K(=08) anymore, as it is in our stemma and as it was in 1973 in Goossens's stemma. In other words, we decided to collapse the K/G(=07)-branch and Goossens decided to put it at a separate branch. The evidence for his decision, quoted in footnote 166, is rather poor. There is no reason to withdraw our proposal. Third, we see one dotted line, indicating contamination. As quoted in footnote 166, Goossens decided to drop the dotted line between A/M(=05) and K/K(=08), which was present in his 1973 stemma and which we criticized in §5.2.2. However, he maintains the dotted line between H/BR(=01) and the Antwerp branch without any (new) supporting evidence. Therefore, we can simply maintain our criticism about the dotted line, as mentioned in the previous section.

Goossens's comparison of the pictures in the *Lanseloet van Denemerken* texts is interesting, but unfortunately it does not offer new or important text-genealogical insights. Therefore, this part of Goossens (1976) will not be discussed here.

Our conclusion is that Goossens (1976) does not give us any reason to adapt our stemma; we maintain it. Furthermore, the software did not miss any of the variants mentioned by Goossens (1976).

5.2.4. THE PART OF THE *LANSELOET* STEMMA IN HÜSKEN & SCHAARS (1984)

In §4.7.3, we discussed some properties of the *Lanseloet van Denemerken* texts. We mentioned that Hüsken & Schaars (1984:11-21) studied the relationships of three *Lanseloet* texts: U/P(=12), which is the oldest van Poolsum imprint from 1684, U/LE(=13), which is the younger van Poolsum imprint from 1708, and S/BO(=14), the 's-Gravenpolder manuscript, which contains the texts of the Lanseloet and Sandrijn roles. Hüsken & Schaars (1984) label them, respectively, VP1684, VP1708 and sG. Their stemma for these three texts is pictured in fig. 133,[167] while a part of our stemma is printed in figs. 130, 131 and 132.

Hüsken & Schaars (1984) build their chain and stemma with Quentin's *zéro caractéristique*, as presented in a text-genealogical standard work by Froger (1968). In other words, they use the following rule. If two texts show all the text-genealogical variants present in a third text, and the third text does not have any text-genealogical variant (i.e. the *zéro caractéristique*) that does not occur in both texts, the third text is the intermediate of both texts. In §3.2.2, we discussed Quentin's approach and criticized it because of its *non-positivistic* or *non-determinable* character. The absence of indications that a manuscript is not intermediate does not guarantee that the manuscript actually is intermediate.

---

[167] In their stemma the left and right branches take mirrored positions: the Sg branch is pictured at the right and the VP1708 branch is at the left side. By mirroring or swapping left and right branches, the stemma itself does not change. It expresses the same text-genealogical relationships.

The difference between both stemmas is evident. In the stemma of Hüsken & Schaars, text VP1684, our U/P=12, is the common forefather of the other two texts; it is not in our stemma. This difference is not as big as it may seem. It can be described in two ways.

First, we can say that the difference between both stemmas consists of only one collapsed branch. Fig. 130 offers the uncollapsed version of a part of our stemma, in which the lengths of the branches are mentioned. We only allowed the U/P=12 branch to collapse, which is leading to our stemma in fig. 131. Fig. 132 is an adapted version of fig. 131 which includes the lengths of the branches.

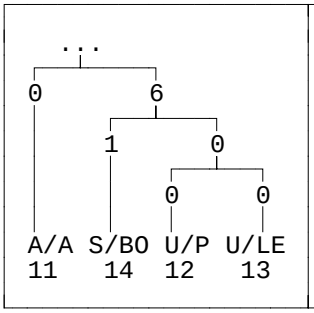

Fig. 130. Repetition of a part of our uncollapsed stemma, with the distances included (see fig. 110).

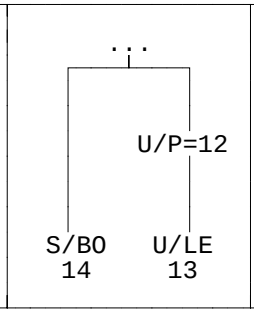

Fig. 131. Repetition of a part of our collapsed stemma (see fig. 111).

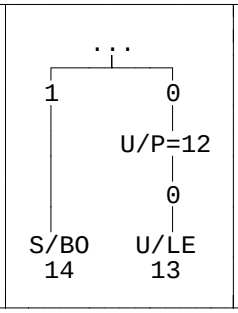

Fig. 132. A part of our collapsed stemma, with the distances included.

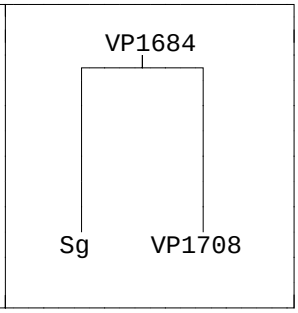

Fig. 133. Stemma by Hüsken & Schaars (1976). VP1684 is our U/P=12; Sg is our S/BO=14; VP1708 is our U/LE=13.

When we compare 'our' fig. 132 with 'their' fig. 133, we clearly see that in Hüsken & Schaars (1984) the zero length branch above our U/P=12 seems to have collapsed as well, which establishes this text as the common forefather of the other two texts.

Second, we look at the chains, the deep structures of both stemma parts. They are equal: S/BO=14—U/P=12—U/LE=13 is Sg—VP1684—VP1708. In our stemma, the chain is oriented on the line between S/BO=14 (their Sg) and U/P=12 (their VP1684), while the point of orientation in Hüsken & Schaars's chain is text VP1684. In other words, the position of the points of orientation in our chains is different.

Hüsken & Schaars (1984:15-21) claim that it does not make sense to orient the chain on a lost text on the line between Sg (our S/BO=14) and VP1684. They do not support their claim sufficiently. First, on their pages 15 to 20, they look at the three texts Sg, VP1684 and VP1708 as if the deliverance was *non-abstract* or *closed* ('de gesloten overlevering'). In such case, it is assumed that all the texts have been delivered and no texts have vanished. Furthermore, no lost texts can be imagined on the lines of connection in the chain or stemma. Under these 'closed' conditions they develop the chain Sg—VP1684—VP1708 and demonstrate that it cannot be oriented at the node Sg, nor at the node VP1708, since it is younger than VP1684. That leaves VP1684 as the only possible point of orientation,

because in the closed deliverance, no lost texts can be imagined on the lines of connection between the nodes. Second, on their pages 20 to 21, they propose to accept the deliverance of the texts as if it was *abstract* or *open* (‘de open overlevering’), thus admitting that texts may have vanished. However, they simply maintain the conclusions drawn from the closed situation; they still consider VP1684 to be the point of orientation in the chain. They admit that in the chain one or more lost texts may be assumed on the line between VP1684 and VP1708, but unfortunately they do not take into consideration that the chain can be oriented there as well. Of course, we understand, as explained in §3.2.2, that it would be convenient if VP1684 was the common forefather of the other two texts. Then, we could say something about the age of text Sg, which was one of the goals of the text-genealogical research of Hüsken & Schaars. If VP1684 is the forefather of text Sg, Sg cannot have been produced before 1684.

Furthermore, the variants used by Hüsken & Schaars, do not exclude the possibility that our stemma is correct, although the consequence is that the dating of Sg (= S/BO=14) becomes more difficult. We will discuss their variants.

Hüsken & Schaars have a good eye for the text-genealogical powers of the variants they use. From the sixty-eight observed variants, they use only three variants. They discarded sixty-five variants with the help of Froger (1968), who offers a good guide for the detection of text-genealogical variants. On the basis of these three variants they conclude that texts VP1684 (our U/P=12) and Sg (our S/BO=14) are more closely related than VP1708 (our U/LE=13) and Sg.

02.250 En(de) legghen dan voert als een hont [223]	02.251 Al sonder spreken als een katijf [224]
01.285 En(de) ligghen voert ane als een hont [256]	01.286 Sonder spreken als een keytijf [257]
05.250 en(de) ligghen dan voort als een hont	05.251 Ende sonder spreken als een katijf

14.193 en liggen dan als eenen hont	14.194 en sonder spreken als een katyf

Figure 134. *Lanseloet* verses 02.0066 and 02.0067: text 13 mentions ‘Ende liggen dan’ twice; this dittography is evidently incorrect; it shows that text 13 cannot have been the immediate forefather of texts 12 and 14.

In the verse with their number ‘134’ (our base text verse 02.0251; see fig. 134), texts U/P=12 and S/BO=14 have ‘sonder spreken’, while text U/LE=13 has the evidently incorrect[168] ‘liggen dan’. In the first instance, I overlooked these

[168] In Appendix C we see that text U/P=12 and most other texts have the two verses 12.0256 ‘Ende liggen dan als eenen Hont/’ and 12.0257 ‘Ende sonder spreken als een Katijf/’. Text U/LE=13 has the same verse 13.0256 ‘Ende liggen dan als eenen Hont/’, followed by the different verse 13.0257 ‘Ende liggen dan als een Katijf/’. The verb ‘liggen’, mentioned in text U/LE=13 twice, is caused by

competitive variants, because they are type-1 variants, as explained in footnote 125. On the other hand, Hüsken & Schaars seem to have overlooked the inversion of two verses in S/BO=14, as detected by the software (see fig. 83). All we can conclude from their '134' variant is that text U/LE=13 cannot have been the forefather of the other two texts. The variant (which is in agreement with our stemma) does not show that texts U/P=12 and S/BO=14 are necessarily more closely related than texts U/LE=13 and S/BO=14.

In verse 409 (our base text verse 02.0479; see fig. 135), texts U/P=12 and S/BO=14 have 'Och'/'och', while text U/LE=13 has 'O'. This is in accordance with our stemma as well. Nevertheless, we claim in this dissertation that different adverbs and differences between small words may not be used for text-genealogical purposes.[169] From this point of view the variant must be rejected, because its text-genealogical trustworthiness is, at the very least, doubtful.

Figure 135. Output in Appendix C, *Lanseloet* verses 02.0479: Hüsken & Schaars (1984) use the presence of the adverb 'O' in text 13 and the presence of the adverb 'Och' in texts 12 and 14 for text-genealogical purposes; characteristic 4b forbids to work with adverbs for the development of chains; besides, 'O' and 'Och' are small words, forbidden by characteristic 11a.

In verse 443 (our verse 02.0525; see fig. 136), texts U/P=12 and U/LE=13 have 'rechtvaerdigheyd(t)' and text S/BO=14 'rechte waerheyt'. Again, our stemma agrees with these variants. 'Special cases' (§12.2.6 of Appendix D) show that these variants occur in an environment in which the rhyme is not optimal. It is dangerous to draw text-genealogical conclusions from variants in such an

---

a typical error of a copyist, which is called in French a 'saut du même au même' (see: Froger (1968:13); Hüsken & Schaars (1985:14)).

[169] Although this claim has not yet been evaluated, the 02.0302 and 02.0479 verses show that the occurrence of 'och' and 'o' in the texts is arbitrary or not in accordance with the (later on to be detected) text-genealogical relationships of the *Lanseloet* texts. Notice that 'O' occurs in fig. 135 in texts 01, 05 and 13; these three texts do not belong to a text family in the stemma (in fig. 111).

environment. Nevertheless, the words or variants themselves are not in rhyming position. We advise caution in analysing the environment of these variants. Furthermore, I do not understand the meaning of combination ‘rechtvaerdigheyd(t) uytleght’ (‘explain justice’). It is likely that copyists did not understand it neither. Therefore, we hesitate to use this variance for text-genealogical purposes. All the same, we conclude that text S/BO=14 cannot have been the common forefather of texts U/P=12 and U/LE=13.

02.524 Dat bid ic v dat ghi mi segt [474]	02.525 Ende die rechueerdicheyt spreect
01.555 Dat biddic v dat ghi mj segt [503]	01.556 En(de) die rechte waerheit sprect [504]
05.532 Dat bid ic v dat ghi mi segt	05.533 En(de) die rechtuaerdicheit daer af spreect
06.533 Dat bidde ich v dat yr myr segt	06.534 Ind die rechtuerdicheit sprect
07.532 Dat bidde ich v dat yr myr seget	07.533 Ind die rechtuerdicheit sprecht
08.532 Dat bidde ich vch dat yr myr saget	08.533 Ind die rechtuerdicheit sprecht
09.529 Des bid ic u dat ghy my dat segt/	09.530 Ende die rechtvaerdicheyt sprect
10.536 Des bid ick u dat ghy my dat seght	10.537 Ende die rechtveerdicheyt spreeckt
11.540 Des bid ick u dat gy my dat seght/	11.541 Ende die rechtvaerdicheyt uytleght
12.541 Des bid ick u dat ghy my dat seght/	12.542 Ende die rechtvaerdigheydt uyt-leght/
13.541 Des bid ick u dat gy my dat seght/	13.542 Ende die rechtvaerdigheyd uyt-leght/
03=>*	03=>*
04=>*	04=>*
14.336 dus bid ick u dat ghy mij dat seght	14.337 en de rechte waerheyt wtleght

Figure 136. *Lanseloet* verses 02.0524 and 02.0525: in text 14 ‘rechte waerheyt’ is present, while texts 12 and 13 have rechtvaerdigheyd(t)’; it is remarkable that the text 14 variant is also present in the manuscript Van Hulthem (text H/BR=01).

We also conclude that Hüsken & Schaars’s claim that texts U/P=12 and S/BO=14 are more closely related than texts U/LE=13 and S/BO=14 cannot be maintained, although it is in agreement with our stemma. All we know is that the three texts belong to one family, that text U/LE=13 cannot have been the forefather of texts U/P=12 and S/BO=14, and that text S/BO=14 cannot have been the forefather of texts U/P=12 and U/LE=13. Therefore, there is no reason to change our stemma. The three variants they use, whether correct or incorrect, are totally in agreement with our stemma.

Finally, our software has treated the sixty-eight variants observed by Schaars and Hüsken correctly. The software even detected a variant which they did not present (see fig. 83). This variant is used in formula 51 in fig. 84.

5.2.5. Results of the Comparison of Our Stemma with the Other *Lanseloet* Stemmas

The comparison of our stemma with other *Lanseloet* stemmas in the previous sections showed that we can maintain our stemma; there is no reason to reject it. Generally, the differences between our stemma and the other stemmas are caused by the use of (probably) incorrect, not text-genealogically trustworthy variants. Furthermore, we saw that our software treated all the variants observed by Goossens and by Hüsken & Schaars correctly. The software even detected a variant which Hüsken & Schaars do not present.

One interesting question is how it is possible that Goossen's stemmas are almost the same as our stemma, while he is accused of using incorrect, parallelistic variants. Once we have developed a trustworthy stemma, we can check if potential parallelisms turn out to be true parallelisms. At this stage, we can only say that a superficial investigation shows that in the *Lanseloet* case a potentially parallelistic variant is most of the time in agreement with the text-genealogical tree. We must keep in mind, however, that a single variant can have enormous consequences for the development of a tree. One trustworthy variant can change the whole appearance of a text-genealogical tree. This can be observed in our stemma in fig. 110, which pictures the lengths of the tree branches. We see a rather large number of branches with a length of '1', implying a difference of only one variant. Furthermore, we must remember that only a few (incorrect) variants caused Goossens to draw his incorrect lines of contamination.

We know that in the case of the *Lanseloet van Denemerken* text versions many potentially parallelistic variants are in accordance with the stemma. Of course this is hindsight, that we acquired after we managed to build a trustworthy text-genealogical tree. Nevertheless, we could say that most variants, parallelistic or not, do not cause *bias* (i.e. incorrect variants, not in agreement with the chain or stemma). In that case, it is tempting to investigate whether there are possibilities for mathematical or statistical techniques to filter out the variants that cause bias, and analyze them. These techniques have already been criticized in §2.5.3 and §3.2.2. Currently, I do not believe that reliable statistical techniques are available for this purposes. A single variant can give us more information about the shape of a tree than a thousand others. My fear is that statistics (a.o. working with the Law of Great Numbers; see §3.2.1), filter out one (good) single variant when it is, for instance, in contradiction with two or more other (incorrect) variants that are in contradiction with that unique variant.

5.3. EVALUATION OF THE TEXT-GENEALOGICAL CHARACTERISTICS

Now that we have a seemingly trustworthy stemma[170] of the *Lanseloet van Denemerken* text, we will investigate in the next eleven sections whether the characteristics must be reformulated, adapted or rejected. Mainly, this evaluation will be based on the computer output, which is schematically presented in Appendix D.

---

[170] I repeat - see a.o. §4.7.4.3 - that we assume that our *Lanseloet* chain or stemma is correct, because it has an optimal consistency, since all the forty-five selected variation formulas are in agreement with it. In other words, there is no good reason (in casu one variation formula) to assume that our tree is incorrect. I repeat that we cannot *prove* that the tree is absolutely correct. The *Lanseloet* tree is the result of the application of the text-genealogical characteristics, which are hypotheses. Hypotheses cannot be proved: they can only be falsified or asserted/confirmed.

The evaluation of the text-genealogical characteristics needs some explanation here. For the evaluation, we can use the distances between texts or the end groups as expressed in the chain.

First, we will discuss the use of the distances. In §4.7.4.2 and §4.7.4.4, we saw that the distances between texts provide information about the relationships between the texts. As we know, the software performs the theoretical characteristics. One of them is, for instance, characteristic 4b (see §3.3.1). It says that text-genealogical variants must be substantives or main verbs. If two variants belong to other word classes, this characteristic forbids us to use them as text-genealogical building blocks. In this evaluation chapter we want to find out, for instance, whether characteristic 4b makes sense. The software gives us an extensive report of all the tested variation formulas, presented in Appendix D. It tells us which characteristics are responsable for the rejection of a formula. Therefore, we can easily find all the variation formulas which are rejected by characteristic 4b. All we have to do now is to find the variation formulas that are filtered out by characteristic 4b and which are clearly not in agreement with the *Lanseloet* tree.

We can take the following as an example. The type-2 formula

```
02.0196 12 ^comb.: 01-14-|02-05-06-07-08-09-10-11-12-13-="o"|"og"
                   (^:W1=Av;W2=Av;4a+;4b-)
```

expresses that texts H/BR=01 and S/BO=14 belong to the same group, because both texts have the variant ‘o’ in common. Characteristic 4b (‘4b-’) forbids (‘^comb’) us to use it as a formula for building the *Lanseloet* chain with. In §4.7.4.4, we saw that the distance between texts 01 and 14 is ‘33’. This large distance implies that both texts are not closely related. Characteristic 4b correctly prevents the formula from being used as a text-genealogical formula for building a tree. In other words, the formula confirms that characteristic 4b is correct (as far as adverbs are concerned). If it would not have been formulated this would have resulted in incorrect variation formulas.

Working with distances is a bit inconvenient. The distance ‘33’ is large because the chain or network measures ‘54’. If the network would have been larger, ‘33’ could have pointed to a close relationship. In other words, distances within a chain are related to the total length of the chain. They are relative.

It is far easier to work with *end groups* in the chain, which will be discussed now. If we look at the chain in fig. 137, we see that the group 01-14- is not an end group (see §2.4.4 and §4.7.1). The tree expresses that texts 01 and 14 are not closely related. If we have a type-2 formula that suggests that both texts are closely related, we know that this formula must be rejected.

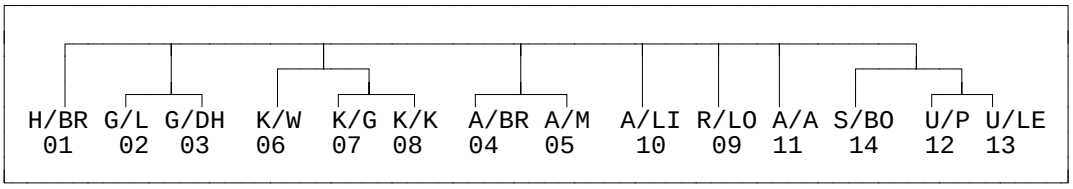

Figure 137. (Repetition of a part of fig. 91:) The definite chain of *Lanseloet van Denemerken*, without the 'distances' on the lines of connection.

In §5.3, we will test the automated characteristics one by one in the sketched way, especially with our knowledge of end groups in the chain. We will try to find variation formulas which would not have been in agreement with our tree, if they would not have been filtered out by a certain characteristic. By doing so, the necessity of that characteristic is confirmed. Similarily, we can test the correctness of the characteristics about which we had doubts. One such characteristic is, for instance, characteristic 8, which claims that a difference in a syntactically adequate *word order* has to be considered as a genealogical variation, as long as the difference in word order does not merely concern a different placement of an adverb in a verse or sentence. If we can find a variation formula which is accepted by automated characteristic 8 while it is not in agreement with the *Lanseloet* tree, the characteristic will be falsified.

I stress that the evaluation of the characteristics refers to the *Lanseloet* texts. If we find out, for instance, that characteristic 8 on word order is incorrect, this does not imply that we have *proved* once and for all that it is not allowed to use this characteristic to develop the text-genealogical trees of other text corpora. All we can conclude is that in the case of *Lanseloet van Denemerken* characteristic 8 is not trustworthy and that we must be careful when using it to develop the text-genealogical trees of other texts. Further research may strengthen or weaken the evaluation of the text-genealogical characteristics.

5.3.1. Evaluation of Characteristic 1

In §3.3.1, characteristic 1 was formulated as follows:

> **Characteristic 1**: Text-genealogical variants belong to the same variation place.

This characteristic is a general assumption - almost beyond dispute - in most text-genealogical theories. It expresses that we must work with truly competitive variants in the same environment.

The difficulty with this characteristic is its implementation or translation into software. When I instructed the computer with statements or expressions in Spitbol/SNOBOL, a computer language (see Coppen & Salemans 1988), how to investigate whether variants are in the same variation place, I taught it to look at

the positions of the variants in the verses. A word or variant has two positions in a verse: a left and a right position. If a verse has, for instance, eight words, the first word has the left position '1' and the right position '8'; the third word has the left position '3' and the right position '6'. If a word in the base text has the same left or right position as a word in another verse, the software thinks that both words are in the same position and, therefore, in the same variation place.

For example, in verse 02.0356, texts 02-05-09-10-11-12-13-14- look like 'Want het is mijns ondancs ghedaen', while the Cologne texts 06-07-08- have something like 'Want het js myr tegen mynen wille gedaen'. 'Ondancs' in the group of eight texts has the left position '5' and the right position '2', while 'wille' in the three Cologne texts has the different left position '7' and the same right position '2'. If the software would not have taken the right position into consideration, we would never had found our variation formula: '02.0356 11 comb.: 06-07-08-|02-05-09-10-11-12-13-14-="wille(n)"|"ondank(s)"'. By using two positions for a variant, it gets, so to speak, two chances. The automated determination whether two variants are at the same variation place only works when the verses of the text are (quite) similar. If a few words in a verse are added or missing this does not matter very much, since each variant gets its two chances.

This *two positions or two chances approach* can be criticized on two points.

First, if text versions differ a lot or have totally different verses it will fail. The two chances approach was developed especially for the *Lanseloet* text corpus and not for general use. Before I started developing the software, a quick study of the fourteen text versions showed me that they ressemble each other. Admittedly, text 01, in the 'manuscript Van Hulthem', is the most deviant text, when compared to the other thirteen texts. This is not too problematic, since the possibly resulting type-1 variation formulas are not taken into consideration for the development of a text-genealogical tree. Obviously, the two positions method fails when *Lanseloet* text versions have completely different contents, e.g. caused by inversion of verses, as is the case in verse 02.0746.[171] During a period of several weeks, I studied whether the two chances method resulted in incorrect variants or caused missing detections of variants. Generally, it did not. It works well for the *Lanseloet* text versions.[172] In retrospect, I think it would have been

---

[171] Other examples of *Lanseloet* texts having quite different verses, can be found, amongst others, in the 02.0081, 02.0085, 02.0241, 02.0398, 02.0610, 02.0746, 02.0850, 02.0892 and 02.1012 verses. The software has built too many variation formulas concerning these and other verses.

[172] The software is corpus-oriented, i.e. designed for use with the *Lanseloet* texts. The eleven text-genealogical characteristics are formulated in such way that they can be used for other texts as well. I tested, for instance, an early version of the (automated) characteristics using seven text versions of (French) *Yvain*. This test was successful (see: Salemans 1996). Nevertheless, when I formulated the 'general' characteristics, I knew that they had to be used for the development of the *Lanseloet* trees. Therefore, for instance, characteristic 5 can only be applied in text versions with rhyming verses. This does not imply that the characteristics are worthless in the case of prose texts. It only implies

better to test first whether variants that occur in verses are alike, before testing whether variants are at the same variation place.[173]

Second, the two chances approach may generate some extra output. This can be demonstrated with an example concerning base text verse 02.0966, as found in Appendix C and in fig. 138. This figure highlights the four variation formulas which we will discussed.

The Appendix C output is presented here and at other places for two reasons. First, it gives the reader a quick look at the situation near certain verses; it is not necessary to browse through Appendix to see how the verses look like. Second, the reader gets an impression of the work the computer has performed, if the reader does not want to browse through the large Appendix C, which is not printed on paper and is available on the cd-rom. In §4.3 and in Appendices A and B we provide more details about the developed computer software.

---

that characteristic 5 cannot be used in a prose environment - but most other characteristics can. The value of my characteristics must be tested in the future, if they can be used with other texts.

I admit that it is possible that the automated recognition of the same variation places, only works for the *Lanseloet* text versions. I consider this to be a technical detail, which does not affect the meaning of characteristic 1. I have not yet reflected on how to automatize the detection of variation places in prose texts. Perhaps, software programs like TUSTEP (see note 94) will be helpful?

[173] As mentioned in Appendix B, §III.a.3, subparagraph ‘Concrete examples of the sixth component’ Olsen (1988) demonstrates how the similarity (or proximity) between two words or longer ‘strings’ can be measured by a computer-generated number. If two verses have a high similarity, it makes sense to determine whether variants are at the same place of variation. If the proximity of the verses is low, we could decide that such determination does not make sense.

In texts 04 and 05 in fig. 138, the adverb ‘so’ has been introduced. This extra word leads to a change of the positions of the other words in both texts. The software detects correctly that (the shorthand word) ‘regte’ in texts 06-07-08- and ‘regt’ in 02-04-05-09-10-11-12-13 are variants, and that ‘rop’ and ‘rip’ are competitive variants as well. This is expressed in the first two highlighted formulas in fig. 138. Then, the software also tries to build variation formulas for the added word ‘so’ in texts 04 and 05. This word takes the left position ‘3’ and the right position ‘7’ in both texts. In the Cologne texts 06-07-08-, the word ‘regte’ has the same right position ‘7’, by which the software assumes that ‘regte’ and ‘so’ are standing at the same variation place. Of course, we know that the variation places differ. But the software does not. It builds the third highlighted formula in fig. 138. Because ‘rip’ in texts 09-10-11-12-13-14- has the same left position ‘3’ as ‘so’, the software develops the fourth highlighted formula.

The two chances approach leads to the result that too many - a few hundred - variation formulas are built by the software. This happens when words have been added or left out in verses. However, in the case of the *Lanseloet van Denemerken* this does not cause problems. Therefore, I decided that it was not necessary to improve the corpus-oriented software on this point. For the future application of the software to other texts, this improvement may end up being necessary. We must keep in mind that the eleven text-genealogical characteristics act as a huge filter. In the case of the *Lanseloet van Denemerken* texts, only one or two percent of the detected potentially text-genealogical variation formulas are passed on to us. In this residue of potentially good formulas, there are no formulas which are the result of the two chances approach. Even if some formulas concerning variants of different variation places would have been passed on to us, we could have detected them quite easily, since it is the philologist who has the last verdict on the correctness of variation formulas.

Our conclusion concerning characteristic 1 is that the computer detection and the definition of the (same) variation place is still not optimal, although it does not cause problems when dealing with the *Lanseloet van Denemerken* texts. We maintain characteristic 1, but we are aware that the definition and/or the automated detection of a variation place and a variant can be improved.[174]

---

[174] See also note 178 and its environment. I do not have any clear thoughts about how to improve the definition of a text-genealogical variant. Currently, I only have vague ideas such as: a text-genealogical variant is the smallest unit with a meaning. *Unit with a meaning* is an elastic concept:
- the greater the difference or distance in meaning, the higher the text-genealogical relevance
- function words, auxiliaries, etc., seldom give a great contrast in meaning
- differences in word order are seldom meaningful
- adjectives often have a ‘collocative character’: ‘beautiful maiden’, ‘brave knight’. Such collocative adjectives do not add meaning or information. Furthermore, such collocations can change regionally or diachronically.

5.3.2. EVALUATION OF CHARACTERISTIC 2

In §3.3.1, characteristic 2 was formulated as follows:

> **Characteristic 2**: Text-genealogical variants are part of a type-2 variation.

This fundamental characteristic, which is also known as the *type-2 limitation*, is discussed throughout this whole book, a.o. in §2.4.3, §2.4.4, §2.6.1, (especially) §3.2.4 and §4.7.3. We are not pleased with this limitation. It would be very convenient if we could use other types of variation as well to build our text-genealogical trees with. Hopefully, it will be possible to break the limitation in the near future (see also footnote 62).

It is difficult to evaluate the second characteristic, because, as a principle, we did choose to develop the *Lanseloet* tree with type-2 (and a few type-1) variations only. In other words, we do not have comparable and competitive non-type-2 material at our possession. In §4.7.1, we succeeded in building a chain with type-2 variations: fig. 74. In §4.7.3, we mentioned that we considered this 'type-2' chain to be a fully acceptable text-genealogical tree. We saw that some minor details were missing from the chain. Nevertheless, we are pleased with the result, a tree with branches which did not collapse. A zero length branch indicates that the text version at the end of it is the same as or comes close to being the forefather of another text. The actual collapsing of a branch does not offer us sensational new text-genealogical insights. Perhaps a tree with collapsed branches looks more attractive, but text-genealogically it does not differ significantly from uncollapsed trees. As mentioned in §3.2.2 and §5.2.4, there is one clear advantage of collapsing branches or determinating intermediate texts. If we can show that a certain dated text X is the forefather of an undated text Y, we know that Y cannot be older than text X, which allows us to date text Y *post quem*.

However, many people are fascinated by the fact that one delivered text version is the forefather of another delivered text version. (*Forefather* is not necessarily the same as *layer text*, because we can imagine lost text versions on every tree branch.) Therefore, we searched for type-1 variation formulas, finally presented in fig. 84, to help fill in the missing details. Not all the possible type-1 variation formulas were examined, because this would have implied a lot of extra work. I decided to search for eye-caching, convincing type-1 variations with an almost indisputable value: type-1 variations concerning characteristic 9b (violations of rhyming conventions), 10 (inversion of verses) and 11b (addition or omission of verses).

Based on our knowledge of the close family or economic connections of the printers of certain *Lanseloet van Denemerken* text versions, we detected that it was more or less allowed to collapse some zero length branches in the chain. In fact, as far as the collapsing of *Lanseloet* branches is concerned, the knowledge of the non-textual history (i.e. the relations of the printers of the texts) provided

enough information to decide whether zero-length branches could be collapsed. We could have collapsed the branches without the knowledge of type-1 variations.

Resuming the evaluation of characteristic 2, we can say that it can be maintained, but that it is good to add an Appendix to it:

> **Appendix to characteristic 2:** to enable the detection of more detailed information about the shape of a text-genealogical tree, it is good to: a. search for text-genealogical variants that are part of a *type-1 variation* and deal with characteristics 9b, 10 and 11; b. study the economic, family or other relationships of the printers or copyists of the delivered text versions in order to detect possible (non-textual) relationships between the text versions.

5.3.3. EVALUATION OF CHARACTERISTIC 3

In §3.3.1, characteristic 3 was formulated as follows:

> **Characteristic 3**: Text-genealogical variants stand in a grammatically adequate environment.

If we want the computer to perform a syntactic analysis of a verse or sentence, it must be fed by a syntactic (and morphological) analysis program: a *parser*. No parsers exist for medieval Dutch languages/dialects, not to speak of parsers that can analyze the *Lanseloet van Denemerken* text versions, written or printed in different geographical areas during a period of more than three hundred years. It was not possible for me to develop such an extensive parser. The software is word-oriented. The consequence is that characteristic 3 cannot be evaluated with software output, since it lacks the syntactic component mentioned. It is up to the philologist to decide whether a detected variation formula concerns two variants that are positioned in a grammatically correct context.

The disadvantages of the lack of a parser have been discussed at several points in this dissertation.[175] Of course, it would have been convenient if we could have worked with a parser, especially for the automatic determination of the word category (see characteristic 4) a variant belongs to. However, we must put the lack of a syntactic parser into perspective. We must realize, for instance, that most of the time a parser will give more than one analysis of the syntactic

---

[175] See §3.3.2; footnotes 87, 89 and 118; Appendix A, Part 3, subparagraph 'Verses near 02.8 and comments', especially the part 'The test of formula b: rejected because of characteristics 4b and 7b'); Appendix A, Part 3, subparagraph 'Verses near 02.10 and comments'; Appendix B, 'III. Information about the computer generated formulas (...)' especially the start, offering remarks about characteristic 3; Appendix B, 'III.a.4 The seventh component, concerning characteristic 4', especially the first part and the part offering 'Concrete examples of the seventh component, concerning characteristic 4', example d; Appendix B, 'III.b.4.1 Information concerning characteristic 11a'.

structure of a sentence. Even if we would have had a (*diachronic*) parser to analyze the Dutch and Cologne language/dialects from about 1400 to 1700, we would have inevitably had to make the final decisions ourselves concerning the ambiguous possibilities. A special kind of parsers, so-called *probabilistic parsers*, are able to give a single analysis of a sentence. The accuracy of excellent probabilistic parsers is about 95 percent, which implies that 1 out of 20 sentences is analyzed incorrectly.

Furthermore, we must keep in mind that sometimes the syntactic laws of normal sentences can be slightly overruled in rhyming verses (caused, for instance, by rhyming and rhythm conventions), while these verses are still acceptable for the reader. Thus, the detection of a non-grammatical sequence in a verse by a syntactic parser can be put into perspective as well.

Finally, having read the texts of *Lanseloet van Denemerken* several times, I conclude that most of the verses are syntactically well-built (perhaps with the exception of the verses offered in fig. 158). In other words, as far as characteristic 3 is concerned, we actually do not really miss a syntactic parser. (Admittedly, I can only say that in retrospect, after having analyzed these texts.) If we assume that all the *Lanseloet* text versions are syntactically adequate, we can simply disregard characteristic 3 for the *Lanseloet van Denemerken* text versions. Of course this does not imply that characteristic 3 is useless for text-genealogical research in general.

Our conclusion concerning characteristic 3 is that we cannot determine its precise value, because the *Lanseloet van Denemerken* verses are grammatically well built - we cannot check the characteristic in an ungrammatical *Lanseloet* environment - and because a parser for the automatic analysis of the verses is not available. Future research must reveal the importance of the third characteristic.

5.3.4. Evaluation of Characteristic 4

In §3.3.1, characteristic 4 was defined as follows:

Characteristic 4 (4a & 4b): Text-genealogical variants belong to the same word categories substantives or verbs.

4a. Text-genealogical variants belong to the *same word classes*.

4b. They are *substantives (= substantive nouns) or verbs*, except auxiliaries (in Dutch: ‘hebben’, ‘zijn’, ‘zullen’, ‘willen’, etc.).

In §5.3.3, we claimed that in the case of the *Lanseloet van Denemerken* the unavailability of a parser to analyze the syntactic adequacy of the verses did not have great consequences. Characteristic 4 speaks of *word categories*. Often a syntactic analysis is needed to determine which word category a variant belongs to. In other words, the lack of a parser is a large handicap in this situation.

Characteristic 4 expresses that, in general, variants are substantives and (main) verbs. Words in these categories have many possible forms, due to declination or conjugation. Words in other categories have a steadier form. Therefore, it is easier to teach the computer to detect non-substantive and non-verbal words. As explained in §3.2.6, footnotes 87 and 98, and in Appendix B, §III.a.4, I developed a thesaurus of non-substantives and non-verbs using a concordance of the shorthand text of the *Lanseloet* texts. If a variant occurs in the non-verbal and non-substantive thesaurus, we know that it violates characteristic 4b and therefore cannot be text-genealogical. In other words, we use the thesaurus to filter out as many variants as possible, hoping that the residue will contain text-genealogical substantives or verbs. 'Hoping', because we can never be sure that the text-versions have genealogical variants with which we can build a good tree, not because I doubt that the software has overlooked some important variants. As we saw in §5.2.1 to §5.2.4, the software has found all the variants mentioned in Leendertz (1907), Goossens (1973), Goossens (1976) and Hüsken & Schaars (1984).

Our simple thesaurus does have its shortcomings and cannot completely replace a syntactic and morphological parser. Furthermore, it needs some 'tuning'.

As we saw in §4.5 (at point 3 on page 143), 46 variants of the final residue of 239 variants would have been filtered out if the thesaurus would have been expanded. On the other hand, some words can be removed from the thesaurus. The shorthand word 'heft', for instance, is labelled in the thesaurus as an auxiliary. This is an incorrect label, because it can also be a main verb, as verse 02.0208 shows. Text 02 has '02.0208 Dat die eedel minne gheeft haesticheyt [185]', while text 05 has '05.0208 dat die edel minne heeft haesticheyt'. Because the thesaurus incorrectly says that 'heft', the shorthand form of 'heeft', is an auxiliary, the software rejects the following variation formula on incorrect grounds:

```
02.0208 10 ^comb.: 04-05-|01-02-06-07-08-09-10-11-="heft"|"geft"
                   (^:W1=Au;4b-)
```

If the word 'heft' would have been removed from the thesaurus, this erroneous rejection would have been prevented.[176]

---

[176] This is not a disastrous error, because other variation formulas clearly express that the group of texts 04-05- is an end group in the text-genealogical tree. Furthermore, I would like to point out that it was the software that enabled me to detect this error. For base text verse 02.0208 the following two text-genealogical remarks are made by the software:

```
02.0208 10 ^treat: 4ch.wrd "geft" in 01-02-06-07-08-09-10-11- (rest: 04-05-)
                    (T3 or T2?);11a?
02.0208 10 ^treat: 4ch.wrd "heft" (Au) in 04-05- (rest: 01-02-06-07-08-09-10-
                   11-) (T3 or T2?);11a?
```

When I started to evaluate characteristic 11b, both remarks were quite eye-caching. They forced me to look at the situation at verse 02.0208, which caused me to detect the error. Nevertheless, as a philologist, I would have chosen to drop the variation formula after all. In Flemish dialects, the

We saw that I built the computer thesaurus based on a computer concordance of the synoptic shorthand *Lanseloet* texts. The frequently used pronoun 'mi' or 'my' is 'mi' in shorthand form. In the concordance with shorthand words, the word 'mi' occurs several hundred times. I looked (too) quickly at the text environments of this word and decided that the shorthand word had to be labelled as a pronoun in the thesaurus. However, when I checked the examples as presented by Goossens (1976:217), mentioned in our footnote 164, I saw that the word 'mey' in texts 06 and 07 near base text verse 02.0081 was presented in the shorthand text as 'mi'. It does not matter much that the verb 'mey' is an incorrect word, as denoted by Goossens with his '(sic)', and that it must be interpreted as the verb 'meyn' (in English: 'mean'). The point is that the conversion of original words into shorthand words, occasionally leads to unwanted or unseen ambiguities.

The previous remarks stress that I am aware of the fact that the computer thesaurus is not optimal and has caused some errors. However, I repeat that I did intend to replace a parser with my simple thesaurus. The goal of the thesaurus was to filter out variants that do not belong to supposed non-text-genealogical word categories and to enable us to evaluate this filtering. These goals have been reached, as we will see.

We conclude that the thesaurus is a handicapped and has misjudged a few variants. However, we feel that the thesaurus worked reasonably well, although it is not a perfect alternative for a parser.

5.3.4.1. Evaluation of characteristic 4a

Characteristic 4a expresses that variants must belong to the same word class.

The output of the software does not enable us to evaluate this characteristic satisfactorily, because it is closely connected to characteristic 4b. Characteristic 4b tells us that genealogical variants are verbs or substantive nouns. We mentioned in the previous section that all the text-genealogical characteristics act as filters that reject ungenealogical variants. Characteristic 4a does not add extra filtering capacities to the currently automated characteristics. As we know, the computer thesaurus only contains word classes that are presumed ungenealogical. Nouns and verbs are not present in the thesaurus.[177] Logically, if the software encounters or

---

difference between the 'h' and a 'g' is vague and therefore parallelistic.

[177] A reviewer remarked that if the shorthand word for the verb 'zyn' ('to be') is 'zin' and the shorthand word for the verb 'zyen' ('to see') is 'zin' as well, this may cause trouble. In the first case 'zin' would be ungenealogical and in the second case it would be genealogical. Of course this observation stresses the importance of a parser, which can analyze the difference between 'zyn' and 'zyen'. However, I repeat (see a.o. §3.2.6) that the thesaurus of shorthand words is corpus-oriented, i.e. strictly bound to the *Lanseloet van Denemerken* texts. Within this corpus, the word 'zyen' does not occur. In other words, in our corpus the 'zyn'/'zyen' problem does not exist.

recognizes a variant of a certain word class, this implies that the variant belongs to a presumed ungenealogical word class. Then it does not matter whether both variants belong to the same or different word classes. If we decided to remove characteristic 4a from our software, characteristic 4b would still filter out the old 4a cases. Therefore, for filtering purposes we do not need characteristic 4a.

Does this imply that characteristic 4a is useless? Future research - hopefully with parser-oriented software that is able to recognize substantives and verbs properly - may provide better information about the true value of characteristic 4a. Perhaps such research will demonstrate that variants do not need to belong to the same word classes. Then 4a can be rejected. Consider for instance the example, presented in fig. 139. We see that it is possible that a noun ‘He(e)r’ (in English: ‘Lord’) can change in the non-noun ‘Hoe’ (in English: ‘How’?); or vice versa. This is not a rejection of characteristic 4a, because the grammatical correctness (characteristic 3) of the ‘Hoe’ verses may be doubted. Nevertheless, we see that a switch from one word class to another cannot be excluded. Perhaps, it is possible that a verb can change into a noun, or vice versa.[178]

```

Figure 139. Appendix C, *Lanseloet* verses 02.0497: a noun ‘heer’ can change into an adverb ‘hoe’ (or vice versa).

[178] The current definition of a place of variation (see: §3.2.3) does not mention that the competitive variants must be in the same syntactic position. Perhaps this syntactic element should be included in the definition? Currently, ‘Hoe’ and ‘Heer’ are in the same place of variation, although they have clearly different syntactic functions. This refinement of the definition must be studied in the future.

For the time being, we maintain characteristic 4a. Although characteristic 4a has not been confirmed by our handicapped non-noun and non-verb software, it has not been falsified either. Furthermore, I am still attracted to the concept behind 4a. If, for instance, at a certain variation place a verb changes into a comparable verb, it is likely that this change fits well and inconspicuously (see our first text-genealogical basic rule in §3.2.1). If a verb changes into another word category, it is more likely that this change will be detected by a copyist. Future research may confirm or strengthen characteristic 4a.

5.3.4.2. Evaluation of characteristic 4b

Characteristic 4b says that we must use verbs or substantive nouns as variants. In §4.7.4.3, we saw that the chain of the *Lanseloet van Denemerken* text versions has a maximal consistency. The genealogical variants we used to build it - most of them are substantive nouns and verbs - do not contradict the *Lanseloet* tree. They all confirm it. In other words, characteristic 4b is not falsified by the variant material and is still standing.[179]

Characteristic 4b will become more trustworthy, if we can find variants that do not belong to the noun or verb categories and that clearly contradict the developed text-genealogical tree of *Lanseloet van Denemerken*. We will use chapter 4 of Appendix D for our search and present the contradictory formulas by word category in the following sections. In section 5.3.4.2.1 the adjectives will be discussed, in §5.3.4.2.3 the adverbs, in §5.3.4.2.5 the articles, in §5.3.4.2.7 the auxiliaries, etc. Notice that this enumeration only mentions sections ending with an odd number. In the intermediate 'even' sections §5.3.4.2.2, §5.3.4.2.4 and §5.3.4.2.6, we will treat miscellaneous, but somehow related, subjects.

As we will see, the number of non-noun and non-verb formulas that contradict the stemma is limited. Therefore, sometimes it will not be possible to draw absolute conclusions about the trustworthiness of non-verbal and non-noun word categories as text-genealogical informants. Furthermore, we stressed that our conclusions must be tested in the future in other situations as well.

5.3.4.2.1. Evaluation of the Word Category Adjectives

```
02.0311 09 ^comb.: 02-04-05-|01-09-10-11-12-13-="bet"|"bat"
                   (<:e|1vow.;7b)(^:W2=Aj;4b-)
02.0642 11 ^comb.: 02-06-07-08-|01-05-09-10-11-12-13-="vro"|"vrog"
                   (^:W1=Aj;W2=Aj;4a+;4b-)
02.0711 11 ^comb.: 02-09-10-12-13-|01-04-05-06-07-08-="bet"|"bat"
```

[179] In §5.3.4.1, we suggested that future research may show that characteristic 4a can be rejected. This may have implications for characteristic 4b. Currently, 4b expresses that both variants must be verbs or substantive nouns. But once 4a is rejected, we may have to consider the possibility that it is enough if only one of the competitive variants is a verb or a substantive. Then, characteristic 4b will be more flexible, in the sense that it will filter out fewer variants.

```
                    (<:e|1vow.;7b) (^:W2=Aj;4b-)
02.0771 11 ^comb.: 08-10-|02-04-05-06-07-09-11-12-13-="leste"|

                    (^:W1=Aj;W2=Aj;4a+;4b-)
```

These six variation formulas, from Appendix D, are in contradiction with the family relations as pictured in fig. 111, the stemma of the *Lanseloet van Denemerken* texts. (Appendix D offers more contradicting formulas, but these six are the most convincing.) The second variation formula, for instance, expresses that texts 02-06-07-08 belong to one text family while 01-05-09-10-11-12-13 belong to another family. However, the difference between ‘vroe’ and ‘vroeg’ is small and therefore potentially parallelistic. We expect that ‘vroe’ (in shorthand notation ‘vro’) could easily turn into ‘vroeg’ (in shorthand ‘vrog’) or vice versa. The computer did not recognize the small difference, because it was not taught that a difference of a ‘g’ in final position - under certain conditions - is small, by which it can be rejected by characteristic 6a. Such an approach would be too powerful and too ad hoc. More or less the same is true for the variants ‘leste’-‘laetste’ (in shorthand notation ‘latste’) and ‘bet’-‘bat’; it seems to me that these variants can be interchanged quite easily as well.

The fifth variation formula concerning the variants ‘grot’ and ‘swar’ of verse 02.0866 seems to offer the first good indication that we should not use adjectives as text-genealogical variants. Our stemma in fig. 111 shows that texts 05-11-12-13-14- cannot belong to a family in which the texts 09 and 10 are not included. The computer output concerning the 02.0866 verses, as to be found in Appendix C, is presented in fig. 140. Unfortunately, we cannot draw absolute conclusions from this ‘groot’ versus ‘swaer’ case. ‘Groot’ (in English: ‘big’) and ‘swaer’ (in English: ‘heavy’) are such common words with such a closely related meaning, that it is likely that they can be interchanged. This brings the danger of parallelism with it. As we saw in footnote 52 (and its environment), such common words cannot be used for building trees, even if they are substantives or verbs. Therefore, this variation formula does not offer the evidence that we should not use adjectives as text-genealogical informative word categories. The same can be argued for the variants ‘schoone’ (in English: ‘beautiful’) and ‘reine’ (in English ‘clean’, ‘bright’) in the sixth variation formula.

Perhaps, one may think that I simply do not give certain observations - here concerning adjectives - a chance to falsify the *Lanseloet* chain. This is not true. The chain is the product of my text-genealogical characteristics or hypotheses. If there are counter examples that seem to show that the characteristics (and the chain produced by them) are incorrect, it is normal that I try to defend ‘my’ characteristics by checking whether the examples may be false or incorrect. If they are or may be false, they cannot falsify the theory or hypotheses. Of course, if they are undoubtedly and convincingly correct, they falsify one or more hypotheses. The adjective examples simply do not falsify convincingly the chain.

```

Figure 140. Appendix C, *Lanseloet* verses 02.0866 (concerning the adjectives ‘swar’ and ‘grot’).

We conclude that there is no convincing evidence that adjectives cannot be used as text-genealogical word categories. It simply takes more (future) text-genealogical research to test the text-genealogical trustworthiness of adjectives.

5.3.4.2.2. An Alternative Lanseloet Stemma with Contaminated Texts 04 and 05?

The sixth variation formula, presented at the beginning of the previous section, with the group 01-05-, brings us to discuss another text-genealogical problem. When we search for the string ‘01-04-05-’ in Appendix D, we find about hundred formulas in which text 01 and text 05 have a variant in common that is not present in texts 02, (03,) 06, 07 and 08. Often text 04, of which only fragments have been delivered, has the same variants as text 01 and 05. Some of the hundred Appendix D formulas are:

```
02.0011 10 ^comb.: 02-06-07-|01-04-05-11-12-13-14-="wort"|"wert"
                   (<:e|1vow.;7b) (^:W2=Mx;4b-)
02.0048 13 ^comb.: 01-04-05-|02-06-07-08-09-10-11-12-13-14-="og"|"o"
                   (^:W1=Av;W2=Av;4a+;4b-)
02.0218 09 ^comb.: 01-04-05-|02-09-10-11-12-13-="tuwen"|"tot"
                   (^:W2=Pp;4b-)
02.0236 09 ?comb.: 01-04-05-|02-09-10-11-12-13-="hat"|"hadde"
                   (<:d|t;fin-e;7a;6a) (W1=Au;W2=Au;4a+;4b?;ok?)
02.0302 13 ^comb.: 02-06-07-08-|01-04-05-09-10-11-12-13-14-="wat"|
                   "dat" (^:W1=Mx;W2=Mx;4b-)
02.0728 12 ^comb.: 02-06-07-08-|01-04-05-09-10-11-12-13-="sgon"|
                   "sgonen" (<:fin-en;7a) (^:W1=Aj;4b-)
02.0764 08 ^comb.: 02-06-07-|01-04-05-10-14-="wel"|"wille"
                   (^:W1=Av;4b-)
(etc.)
```

There are also vague signs, in the form of six variation formulas, that text 04 and 05 show a contaminated relationship with text 02:

```
02.0015 10 ^comb.: 02-04-05-|01-09-10-11-12-13-14-="mer"|"mar"
                   (<:e|1vow.;7b) (^:W1=Co;W2=Co;4a+;4b-)
02.0050 13 ^comb.: 02-04-05-|01-06-07-08-09-10-11-12-13-14-="~si"|
                   "~sin" (<:fin-n;7a)
02.0221 12 ^comb.: 02-04-05-|01-06-07-08-09-10-11-12-13-="doter"|
                   "dot" (?<:affix(es);7a) (^:W2=Au;4b-)
02.0311 09 ^comb.: 02-04-05-|01-09-10-11-12-13-="bet"|"bat"
                   (<:e|1vow.;7b) (^:W2=Aj;4b-)
02.0734 11 ^comb.: 02-04-05-|01-06-07-09-10-11-12-13-="minre"|
                   "minder" (^:W1=Pn;W2=Pn;4a+;4b-)
02.0933 12 ^comb.: 02-04-05-|01-06-07-08-09-10-11-12-13-="blom"|
                   "blome" (<:fin-e;7a)
```

However, these six formulas seem to be outnumbered by the (about) hundred formulas pointing at a relation of texts 04 and 05 with text 01.[180]

None of the variation formulas mentioned so far in this section has a high degree of text-genealogical trustworthiness according to our system of text-genealogical characteristics; the software determined that none of them was text-genealogical. Otherwise, they would have been mentioned in our corpus of variants, with which we built our *Lanseloet* tree. The hundred variants have been rejected by one or more text-genealogical characteristics. Each rejection makes sense and can be defended. However, the number (of hundred) rejected formulas is so high, that we consider the possibility that texts 04 and 05 or their common forefather is contaminated with text 01 (or its forefather or a vanished descendant of it). If this assumption is correct, our stemma would look like the one in fig. 141.

Notice that the dotted line in fig. 141, expressing the contamination between text (H/BR=)01 and text (A/BR=)04 and (A/M=)05, is also present in Goossens's 1973 and 1976 *Lanseloet* stemmas, as pictured in our figs. 117 and 128. In §5.2.2, we rejected this dotted line because Goossens did not offer convincing evidence for it. Now, the line has been reintroduced, based on other, more numerous variation formulas.

The question is which stemma is better: the *uncontaminated* one in fig. 111 or the *contaminated* one in fig. 141? At first sight, the advantage of the contaminated stemma seems to be that it explains or incorporates more variation formulas. However, this advantage is deceiving. If we add a few more lines of contamination to the stemma, almost any variation formula we can think of will be in accordance with the tree. Furthermore, a contaminated stemma is more complex than an uncontaminated stemma, since it has more lines of descendance.

---

[180] Of course, the fact that a certain variation formula is outnumbered by other competitive variation formulas does not imply that it is unimportant (as the Law of Great Numbers suggests). Sometimes one good formula offers more genealogical information than a thousand other formulas. The quality of the formulas is more important than their quantity.

It is a scientific principle that the most simple explanation for a phenomenon is preferred. The uncontaminated, simpler stemma is the most simple explanation for the relationships of the text versions.

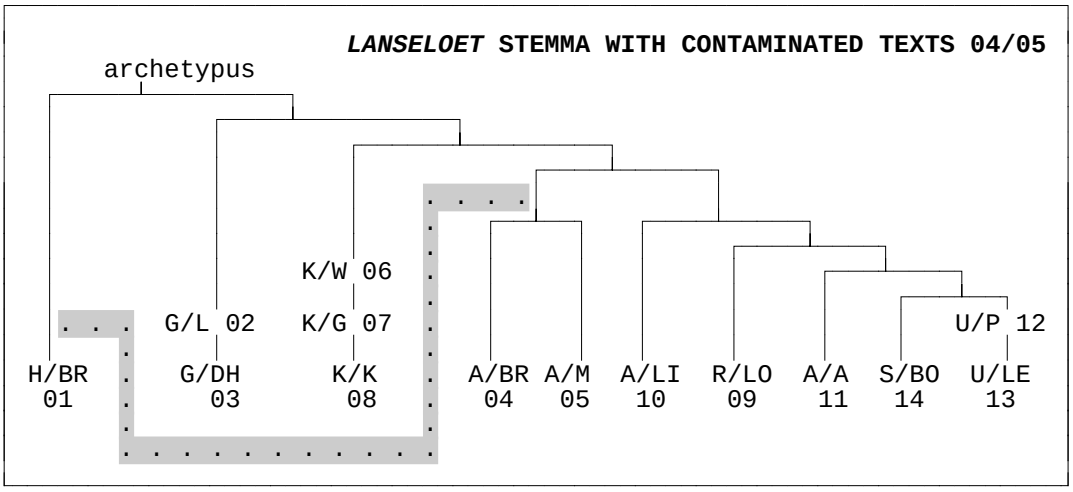

Figure 141. An alternative stemma for the *Lanseloet van Denemerken* texts versions, in which texts 04 and 05 (or a forefather of them) are contaminated with text 01 (or a forefather or descendant of it), as is expressed by the dotted line.

One of the main points of this dissertation is the plea for the use of convincing text-genealogical variants which do not carry the danger of parallelism. If we look at the hundred formulas, we simply establish that none of them is convincing enough to demonstrate the contamination of texts 04 and 05. There is simply no urgent need to reject the non-contaminated tree. Notice that this is not the *proof* that our tree is correct; we only claim that the hundred formulas do not offer convincing evidence to falsify our uncontaminated stemma.

But how can the hundred formulas be explained? The explanation is simple. As the next sections will demonstrate, parallelisms occur more often than we thought was possible. The people who produced the *Lanseloet* versions, generally did not treat the text with much respect, but introduced, perhaps unwillingly, all kinds of personal variants in it. These personal variants could be altered again by other people. If we look, for instance, at the considerable differences between the Cologne texts 06, 07 and 08, we must conclude that the German printers of these texts transformed the *Lanseloet* text with a rather free hand. The Cologne texts made significant changes within a few decennia. Apparently, the aim of the Cologne (and the Flemish and the Dutch) printers/copyists was not to preserve the *Lanseloet* text as much as possible. Economical reasons may have played a role. It is not unlikely that the printers wanted to produce for the market, as quickly as possible, an up-to-date version of the *Lanseloet van Denemerken* text, without old-fashioned or unsuitable words, in the target group's language. This economical goal implied that they respected the main words (e.g. rhyming words!)

and the plot of the texts. Drastic alterations were too laborious. The printer's free hand, focused on production, gave rise to many parallelisms. The same can be argued for texts 04 and 05.[181] Furthermore, we must realize that texts 04 and 05 were printed in Antwerpen, while text 01, in the 'manuscript Van Hulthem', was written in (the neighbourhood of) Brabant; the three texts come from more or less the same region. Therefore, many variants occurring in these three Brabant/Antwerpen texts may be regional parallelisms.

5.3.4.2.3. Evaluation of the Word Category Adverbs

In Appendix D, many examples can be found to demonstrate the parallelistic character of adverbs. I give here some examples:

```
02.0070 12 ^comb.: 02-04-05-07-08-|01-09-10-11-12-13-14-="ni"|"not"

                   (^:W1=Av;W2=Av;4a+;4b-)
```

---

[181] This can be compared with Beckers (1993), who labels texts 02, 04 and 05 with, respectively, the sigla GL, ABR and AM. Beckers (1993:150) points out the economic goals of the printers as well. He is convinced that the Antwerp printers were aware that there was a clear market for the *Lanseloet* text in Antwerpen: 'LvD werd door de drukkers in Antwerpen gezien als een tekst, waarvoor zonder twijfel een markt te vinden zou zijn. Veelzeggend is, dat Adriaen van Berghen op een van de van hem bewaarde titelpagina's van ABR volstaat met alleen de tekst "Sandrijn ende lantslot", gevolgd door een houtsnede (...). De tekst was de potentiële kopers blijkbaar al bekend; er waren geen extra aanprijzingen nodig.' Beckers (1993:172) expresses a.o. that the printers of texts 04 and 05 wanted to produce cheap editions, and that they removed or altered eye-catching unclear elements or rhyming errors in the text: 'Adriaan van Berghen en Willem Vorsterman brachten met hun drukken goedkopere versies van LvD op de markt. Het aantal bedrukte bladen is ten opzichte van GL verminderd van twintig naar achttien en ook het aantal voor de druk vervaardigde houtsneden is afgenomen. Beide teksten zijn bovendien minder zorgvuldig gedrukt dan de Goudse drukken. Dit betekent niet dat het slechts om slordige kopieën van GL gaat. De Antwerpse drukkers probeerden de teksten van al te opvallende fouten te zuiveren. Onduidelijkheden en verstoringen van het rijm werden verbeterd.' It is, by the way, remarkable that Beckers compares texts 04 and 05 with text 02 very closely, while our stemma and other *Lanseloet* stemmas show that, at least, text 02 cannot be considered as the text from which versions 04 and/or 05 were produced.

```
02.0449 10 ^comb.: 09-10-|02-06-07-08-11-12-13-14-="aldus"|"dus"

```

With the next three figures, taken from Appendix C, we can demonstrate the parallelistic character of (the above-mentioned) adverbs in verses 02.0392, 02.0655 and 02.0657. In verse 02.0392 (see fig. 142) the variant ‘dus’ occurs in texts 01-02-03-09-10-, while variant ‘aldus’ occurs in texts 05-11-12-13-; these groups do not agree with the *Lanseloet* tree. The variant ‘sere’ (verse 02.0655; see fig. 143) is only present in texts 01-09-, which is in contradiction with the *Lanseloet* tree as well. Finally, the occurrence of the adverb ‘nergens’ in text 10 (verse 02.0657; see fig. 144) is not in agreement with our *Lanseloet* tree.

```

Figure 144. Appendix C, *Lanseloet* verses 02.0657: the ungenealogical spread of the adverbs ‘nergens’ and ‘niuwers’.

In fig. 145, the deliverance of the variants ‘nergens’ and ‘nye(u)wers’/‘nieuwers’ (verse 02.0675; see fig. 144) is sketched with the use of the stemma in fig. 111. The readings of the common forefathers have been filled in. Of course the difference in spelling between ‘nyewers’ and ‘nieuwers’ is trivial; the common forefather of texts 09, 10, 11, 12 and 13, may have had, for instance, the reading ‘nyewers’ instead of ‘nieuwers’. The point of fig. 145 is that the introduction of ‘nergens’ in the Cologne branch, first appearing in text K/W=06 or one of its forefathers, must have been independent from the introduction of the same word in text A/LI=10 or one of its forefathers. Logically, the adverbial variant ‘nergens’ is a ungenealogical parallelism; the texts with ‘nergens’ in common do not share a unique forefather.

Although most adverbial variants are in agreement with our stemma in fig. 111, the cases presented above demonstrate that many adverbial variants can be found that are parallelistic and are in conflict with our tree. An adverb like ‘so’ can be left out or changed unpredictably and quite easily into ‘also’ or ‘dus’ or ‘aldus’, and vice versa. Adverbs like ‘nie’ (in shorthand notation: ‘ni’), ‘ye’ (shorthand: ‘i’) and ‘noyt’ (shorthand: ‘not’) are closely related in meaning, and can be interchanged easily as well.

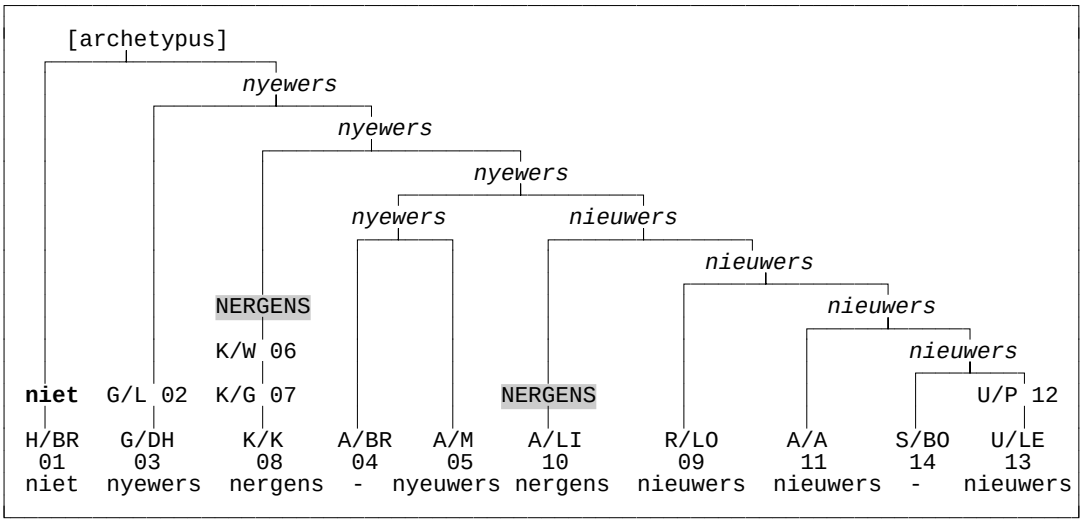

Figure 145. The *Lanseloet* stemma with the variants ‘nergens’ and ‘nye(u)wers’/‘nieuwers’ at verse 02.0657 (see fig. 144) filled in; the appearance of ‘nergens’ in the Cologne branch and in text 10 is coincidental, caused by parallelism.

Although these examples seem to stress that we cannot use adverbs as text-genealogical informants, we must be cautious to draw such an easy conclusion. It is possible that other characteristics play a role here as well. Most of the words concerned are *short words*, which makes it possible that they fall under characteristic 11a, which warns us not to use small words as text-genealogical informants. Furthermore, words like ‘so’, ‘also’, ‘o’, ‘och’, ‘nie’ and ‘noyt’ are *(highly) frequently used* words and fall under characteristic 11a or 7d.[182] However, adverbial variants like ‘nergens’ and ‘niuwers’ (see fig. 145) are neither short words, nor frequently used words.[183]

We conclude that we have several indications that dissuade the use of adverbs as text-genealogical variants in the case of *Lanseloet van Denemerken*. Of course, future research must show whether or not this conclusion is correct when applied to texts other than *Lanseloet van Denemerken*, but that is true for all our conclusions concerning our eleven text-genealogical characteristics.

---

[182] See footnote 52, with the remark by Dain (1949/1975:48) about the ungenealogical character of short words. See also §5.3.11.1.

[183] The word ‘nergens’ (in English: nowhere) is not frequently used, since it occurs at only one other place in the *Lanseloet* texts, verse 02.0555. In this verse almost all the texts have ‘nergens’ (or small, unimportant variants of it). Remarkably, text 01 has the variant ‘niewer’ thee. The word ‘niewer(s)’ does not occur anywhere else in the texts.

5.3.4.2.4. Diachronical, Parallelistic Changes in Flexion/Casus from 1400 to 1700

In §5.3.4.2.5 we will speak about the potentially parallelistic character of articles. Therefore, we must know, for instance, the flexion of the definite article 'the' (in modern Dutch: 'de') and the indefinite article 'a' (in modern Dutch: 'een') during the period between 1400 to 1700 in the Dutch and Flemish regions. The Dutch language and dialects were and are dynamic: they changed during the three centuries. Not taking this diachronical development into consideration, would be the same as acting as if the Dutch language in 1999 was the same as in 1699. The changes of the flexion are visualized in figs. 146, 147 and 148.[184]

Figure 146. Masculine flexion in the Middle Ages, *Twe-spraack* (1584) and 16th/17th century.

[184] The source of the flexion in the Middle Ages in the three figures 146, 147 and 148 is van der Wal (1992:135). I borrowed the parts with the header 'Twe-spraack 1584', the first true grammar of the Dutch language, from Dibbets (1977a:31; 1985:243;456-457). The fifth and sixth cases as offered by the *Twe-spraack* are not presented here, in order to make the several parts of the figures more comparable. The *Twe-spraack* does not offer clear paradigms for the flexion of adjectives. The third part of the figures deals with flexion in the sixteenth and seventeenth century. I took it from de Korne & Rinkel (1987:31). Notice that the *Twe-spraack* is a sixteenth-century grammar and that its paradigms are not completely in accordance with de Korne & Rinkel (1987:31). This illustrates how difficult, if not impossible, it is to give a correct overall sketch of flexion.

Figure 148. Neuter flexion in the Middle Ages, *Twe-spraack* (1584) and 16th/17th century.

We stress that these figures may give the incorrect impression that there was a clear system of flexion. The figures offer the common factor of forms of flexion. An overall system, followed by all the language users in the Netherlands and Flanders, simply did not exist. (This already implies that flexion is parallelistic.) First of all, we must realize that a uniform, standardized Middle Dutch language, spoken until about 1500, never existed. In the Low Countries, several dialects existed, each with its regional or local 'peculiarities'.[185] Second, the language changes did not arise simultaneously in all the 'Dutch' regions. Third, the paradigms in the figures are *casus*-oriented. As we know, the casus of a word should be in accordance with the syntactic function of the wordgroup it is part of. The nominativus occurs, for instance, if the word group is in subject position, the accusativus if it is in object position, etc. It would be incorrect to think that the Middle Dutch (language/dialects) from about 1200 to 1500 strictly followed the casus system in figs. 146, 147 and 148. Van der Wal (1992:142) warns us that the Middle Dutch in the three centuries can be characterized by a general loss of flexion. The use of affixes like '-e' or '-n' reduced or completely vanished. Many Middle Dutch examples are present which show that the affix '-e' in the dativus singularis of the male and neuter gender was not generally used. Furthermore, Van der Wal shows that in the late Middle Dutch the difference between the male nominativus and accusativus often vanished, because the affix '-n' of the article and the adjective in the accusativus fell away. Moreover, many authors, especially in the South, maintained the affix '-n', but in the different function of *genus* indicator (also in the nominativus!). The crumbling of the casus system and its affixes implied that the function of syntactic units had to be expressed otherwise. One way to do this was to reduce the possibilities of (rather) free word order.

In the 16th and 17th century, some scholars tried to reestablish the casus system. The first grammar of the Dutch language was the *Twe-spraack*, appearing in 1584; it offered, a.o., lists of the flexion of the article, the noun, etc. according to their gender and their *casus*.[186] It mentions that the nominativus of the masculine and feminine definite article is 'de'; the nominativus of the neutrum definite article is 'het'.[187] Dibbets (1977a:30) warns us that the casus system as propagated by the *Twe-spraack* and several other grammars had a artificial character. Furthermore, Dibbets (1989) shows that the theory and practise concerning the casus system in the *Twe-spraack* are sometimes contradictory. This

---

[185] I speak of the Low Countries; for the sake of simplicity I set aside the Ripuarian language of the region of Cologne, where texts 06, 07 and 08 were printed. A detailed study of the language in these Cologne *Lanseloets* is offered by Ballard (1995), as mentioned in our footnotes 133 and 161.

[186] The standard edition of the 'Twe-spraack' is offered by Dibbets (1985).

[187] This is in accordance with the occurrence of the article 'het' in the *Lanseloet van Denemerken* versions. The article 'het' appears only in texts 09 to 14, printed around or after the second half of the sixteenth century.

proves that we cannot use differences in casus as text-genealogical tools to build text genealogies.

Of course, this section has a text-genealogical goal. We saw that during the period in which our *Lanseloet van Denemerken* text versions appeared, from about 1400 to about 1700, a standard Dutch language did not exist. It is better to say that a set of Dutch dialects existed, each with its own characteristics. Furthermore, we mentioned the general loss of flexion and the casus system. A complicating factor is that several variants of the casus system existed. Some authors (or copyists or printers) even used a genus system, with the article ‘den’ in subject position; this contrasted the casus system. The text-genealogical message of this section is simple. We cannot use flexion as a trustworthy text-genealogical tool.

5.3.4.2.5. Evaluation of the Word Category Articles

At this point, we want to analyze how the word category articles behaves in the *Lanseloet van Denemerken* text versions. Our claim is that articles are potentially parallelistic word categories. It is not easy to evaluate the articles, because most of them belong to the mixed category: ‘die’/‘dat’ is an article or a pronoun, ‘en’ (shorthand notation for ‘een’ and for ‘en’) can be an article, a conjunction or an adverb (the negation particle ‘en’), ‘het’ can be an article or a pronoun, etc.

In the previous section 5.3.4.2.4, we saw that we cannot use the different forms of the articles, caused by flexion, as text-genealogical tools. We also mentioned that, for instance, printers following the genus system, used the article ‘den’ in the male nominativus singularis. Text A/LI=10 offers us many examples (see fig. 149) of this phenomenon. Sometimes, but less often, ‘den’ can be observed in subject position in text S/BO=14, as demonstrated in fig. 150. This figure also shows that the agreement of the articles ‘de’ (in front of ‘ridder’) in the unrelated texts 06, 07, 11, 12 and 13 is parallelistic.

Figure 151. Appendix C, *Lanseloet* verses 02.0906: an example of the potentially ungenealogical, parallelistic character of the flexion of the indefinite article 'een'; the unrelated (not being an end group) texts 01, 12 and 13 have 'e(e)ne' in common.

So far, we have faced many complications when dealing with the evaluation of several word categories. Therefore, it will not come as a complete surprise that the evaluation of the article has its complications too.

The problem is that *the* Middle Dutch definite article did not exist. The article ‘die’/‘de’ (neutrum: ‘dat’/‘het’) developed from the Middle Dutch pronomen demonstrativum ‘die’ (neutrum: ‘dat’).[188] In other words, originally, only the pronomen demonstrativum ‘die’ (or ‘dat’) existed. Gradually, the less articulated schwa-article ‘de’ grew from it, while the pronoun ‘die’ kept its pointing, demonstrative, function, as it still has today. As explained in §5.3.4.2.4, it is impossible to pinpoint here the exact date of separation or existence of both word categories; the diachronical developments of the non-standardized Dutch language or dialects are too locally and personally bound. However, at the time the article ‘die’/‘de’ emerged, the difference in meaning with the pronomen demonstrativum must have been very small. It is quite likely that many people were not aware of a difference in meaning. We can even imagine that an ‘old-fashioned’ copyist introduced the old form ‘die’ in his text while his source, his layer text, showed ‘de’.

The point is that it is dangerous to draw text-genealogical conclusions when texts show forms of ‘die’ or ‘de’, or ‘dat’ or ‘het’. The *Lanseloet* texts show many examples in which forms of ‘de’ en ‘die’ are used in a parallelistic way (see verses 02.0020, 02.0062, 02.0109, 02.174, 02.0256, etc.). Fig. 152 demonstrates the parallelistic character of ‘die’ and ‘de’.

Figure 152. Appendix C, *Lanseloet* verses 02.0062: an example of the ungenealogical, parallelistic character of ‘die’ and ‘de(n)’.

[188] See Duinhoven (1988:223-260). By the way, it is nice to see that the younger article ‘het’ only appears in *Lanseloet van Denemerken* text versions 09 to 14. These texts were printed around or after the second half of the sixteenth century.

Verse 02.0974 (see fig. 153) offers an example of an ungenealogical parallelistic variance of ‘dat’ and ‘het’. The occurrence of ‘dat’ in texts 10 and 14, and the occurrence of the competitive ‘het’ in texts 09, 11, 12 and 13, is not in agreement with our presumed correct stemma (fig. 111). If text 14 would have had ‘het’, the highlighted variation formula would have agreed with it.

Figure 153. Appendix C, *Lanseloet* verses 02.0974: the occurrence of ‘dat’ in texts 10 and 14 is ungenealogical, not in agreement with our chain/stemma.

The *Lanseloet* texts offer some examples in which the definite article or pronomen demonstrativum changed into the indefinite article ‘een’ (or vice versa). One example is offered in fig. 154. However, after a study of all the occurrences of ‘een’ in the *Lanseloet* texts, we can say that no examples of such changes exist that are not in accordance with our stemma in fig. 111. Fig. 154 demonstrates that ‘die (nacht)’ only occurs in texts 04 and 08, which is a parallelistic, ungenealogical variance as well.

Figure 154. Appendix C, *Lanseloet* verses 02.0316: an example of the change of ‘die kamer’ in ‘een kamer’; notice that this example does not show that such change is ungenealogical.

The conclusion of this section is that articles should not be used for the development of the *Lanseloet* tree, since they can provide false, parallelistic and ungenealogical information about the relationships of text versions.

5.3.4.2.6. The Parallelistic Character of the Gender of Substantives

The example offered in fig. 152 brings us to another point of discussion: the gender of substantives. Fig. 152 shows that text 01 has ‘die wille’ (not: ‘die*n* wille’) in object position, while text 02 has ‘den wille’ in object position. In other words, in text 01 ‘wille’ seems to be feminine, while it is masculine in text 02, presuming that ‘dien’ and ‘die’ are connected to the genus of the word ‘wille’. The MNW (1885-1952:IX,col.2559) teaches that the word ‘wille’ was originally a masculine word; gradually, it became a feminine word. The situation in our texts shows the opposite: the oldest text 01 has the feminine substantive and the younger text 02 has the masculine word. This may indicate that the change of gender of substantives was not a absolute process accepted by all the ‘Dutch’ speaking people. Again, we see that the language change is not universal, but bound to specific regions and people. The least we can say about this matter is that our texts show that the copyists did not agree about the gender of certain substantives. This implies that the gender of a word is not text-genealogically trustworthy. Even in our days the gender of words may differ. In modern Dutch, we say that we drink beer in ‘het café’ (in English: ‘the pub’), while in the Maastricht dialect we drink beer in ‘de kaffee’ (compare also note 193).

Another example of the parallelistic, ungenealogical character of the gender of substantives is offered in fig. 155:

```

Figure 155. Appendix C, *Lanseloet* verses 02.0310: an example of the ungenealogical character of the gender of a substantive.

Text 05 has ‘(in)den strick’, while sister text 04 has the neuter ‘dat strick’.[189] The MNW (1885-1952) shows that many substantives can have two genders.

Our conclusion is that differences in gender of substantives are parallelistic and do not necessarily provide trustworthy text-genealogical information.

5.3.4.2.7. Evaluation of the Word Category Auxiliaries

Appendix D offers many variation formulas, that seem to show the ungenealogical character of auxiliaries:

```
02.0010 12 ?comb.: 02-04-12-13-14-|01-05-06-07-09-10-11-="heb"|
                   "hebbe" (<:2ch;fin-e;7a;6a)
                   (W1=Au;W2=Au;4a+;4b?;ok?)
02.0141 12 ?comb.: 02-05-11-12-13-|01-06-07-08-09-10-14-="wil"|
                   "wilt" (<:fin.t;7a;6a) (W1=Au;W2=Mx;4b?;ok?)
02.0144 12 ?comb.: 01-10-14-|02-05-06-07-08-09-11-12-13-="wilt"|
                   "wil" (<:fin.t;7a;6a) (W1=Mx;W2=Au;4b?;ok?)
02.0149 12 ?comb.: 02-05-06-07-08-10-|01-09-11-12-13-14-="wilde"|

02.0200 06 ?comb.: 09-10-14-|11-12-13-="heb"|"hat"
                   (W1=Au;W2=Au;4a+;4b?;ok?)
02.0276 12 ?comb.: 02-04-06-07-08-|05-09-10-11-12-13-14-="wil"|"mot"
```

[189] One could claim that in ‘inden’ ‘den’ is the third case singular of the word ‘het’ (see fig. 146c). Only three verses further, in verse 02.0313, the word ‘stric(k)’ is mentioned again: texts 02, 04, 06, 07, 08 have ‘int stric(k)(e)’, text 05 has ‘in die stricke’, texts 09, 10, 11, 12, 13 have ‘inden/in den stric(k)’; text 01 has no verse here.

```
                    (W1=Au;W2=Au;4a+;4b?;ok?)
02.0347 08 ^comb.: 01-02-05-|09-11-12-13-14-="hat"|"war"

                    (W1=Au;W2=Au;4a+;4b?;ok?)
02.0434 11 ?comb.: 02-06-07-08-|01-05-09-10-11-12-13-="is"|"sin"
                    (W1=Au;W2=Mx;4b?;ok?)
02.0559 05 ?comb.: 02-14-|06-07-08-="heb"|"hat"
                    (W1=Au;W2=Au;4a+;4b?;ok?)
02.0675 08 ?comb.: 02-09-|04-05-10-11-12-13-="sin"|"is"
                    (W1=Mx;W2=Au;4b?;ok?)
```

Notice that the variation formulas concerning verses 02.0010, 02.0141, 02.0144 and 02.0186 only demonstrate that the flexion of auxiliaries is ungenealogically parallelistic, and not that auxiliaries are ungenealogical. The formula concerning verse 02.0276 is pictured in fig. 156. The variation formula is interesting, because it expresses that texts 04 and 05 belong to different families.[190] This contradicts our stemma in fig. 111, which shows that texts 04 and 05 share a unique common forefather. The explanation for the 02.0276 formula will sound familiar by now; we cannot use auxiliaries as text-genealogical informants because they can be parallelistic. Some other formulas will confirm this explanation.

```

Figure 156. Appendix C, *Lanseloet* verses 02.0276: an example of the ungenealogical character of the (shorthand) auxiliaries ‘wil’ and ‘mot’.

Let us sidestep now for a while and repeat, more or less, why it seems that I am so sure that auxiliaries are parallelistic and why I act as if it has been proved that the stemma in fig. 111 is correct.

The main question of my research was how should a stemma, in our case of the fourteen *Lanseloet van Denemerken* text versions, be built. I developed eleven characteristics (plus some sub-characteristics) from some text-genealogical concepts. These characteristics helped me recognize text-genealogical variants,

[190] Notice that in text 04 the pronoun ‘ick’ is missing, which makes it seem as if Lanseloet orders his mother to leave. However, the following verses clearly show that ‘ick’ is missing, which makes this error easy for a copyist or printer to recognize and repair.

suitable for building text-genealogical trees. Generally, three types of characteristics exist (see §5.1): *positive* (‘we must use variants that ...’), *negative* (‘we can never use variants that ...’) and *dubious* characteristics (‘perhaps we can use variants that ...’). All the characteristics have the status of hypotheses. As we know, hypotheses cannot be proved. They exist as long as they have not been falsified; they may be confirmed, which is not the same as an absolute proof, or they may need to be adapted. I taught the computer to perform the characteristics, because I wanted the recognition or evaluation of variants to be performed consistently and persistently.

At this point, I will not repeat the precise contents of all the characteristics. I had my doubts about some characteristics (for instance no. 8 on word order; see p. 82), while I was convinced that other characteristics were accurate and obviously *indisputably* correct. Of course, I know that absolutely correct, indisputable hypotheses do not exist. Nevertheless, I had the idea to build a text-genealogical tree with these so-called indisputable and positive characteristics, like characteristic 5 that states, roughly speaking, that text-genealogical variants must belong to the word categories of verbs and substantive nouns. The computer found these variants and built a text-genealogical tree from them. I was interested in finding out whether my so-called indisputable and positive characteristics where indeed correct. I was ‘lucky’; the detected text-genealogical variants led to a tree with an optimal consistency. All the detected variants fitted well. This was encouraging, because the optimal tree and the variants confirmed my approach. Of course, this was not the absolute proof that the utilized characteristics are correct. But the optimal tree did not give any reason to believe that there was something wrong with my indisputable characteristics or with the tree. There were no signs that the tree is incorrect. Therefore, I decided to act as if the tree was correct indeed. Assuming that the tree was correct, I decided to evaluate how the dubious characteristics (for instance on word order) behaved in the tree and to find out whether negative characteristics (for instance, characteristic 4b, ‘do not use auxiliaries as variants’) were in accordance with the tree.

We will see that as a result of the evaluation, most characteristics will be confirmed, while a few will be rejected or adapted. The scientific gain is that we know that in the case of *Lanseloet van Denemerken*, certain characteristics (possibly reformulated a bit) lead to a trustworthy tree. The challenge for the future will be to test these (partly new) characteristics on other texts.

Let us continue with the evaluation of the word category auxiliaries. In modern Dutch, there are two, generally accepted, past tenses for the verb ‘willen’ (in English ‘to want’). We can say ‘ik wilde’ (in English: ‘I wanted’) and ‘ik wou’. These two forms already existed in the old days: ‘ic wilde’ and ‘ic woude’. Therefore, it is not surprising that these forms cause ungenealogical variation formulas, as we see in fig. 157 (concerning verse 02.0149).

```
02.149 bi minre riddersgap ik wilde wel    < 02.149 Bij mijnre ridderscap ic wilde wael [132]
01.189 bi riddersgape ik wawde wel         < 01.189 Bi ridd(er)scape ic woude wael [170]
05.149 bi minder trawen ik wilde wel       < 05.149 Bi mijnder trouwen ick wilde wael
06.150 bi minre rittersgap ig wilde wel    < 06.150 By mynre ritterscap ich wilde wael

```

Figure 157. Appendix C, *Lanseloet* verses 02.0149: an example of the ungenealogical character of the (shorthand) auxiliaries ‘wilde’ and ‘wawde’.

Another interesting formula concerns verse 02.0675. The Appendix C output is printed in fig. 158. It is remarkable that texts 02 and 09, which do not belong to the same unique text family, share the variant ‘sijn’/‘zyn’ (in shorthand ‘sin’). This seems to stress that auxiliaries may be ungenealogical. We must be careful, however, to draw such a conclusion. The verses may be ungrammatical; possibly characteristic 3 is violated.

```

Figure 158. Appendix C, *Lanseloet* verses 02.0675: an example of the ungenealogical character of the (shorthand) auxiliaries ‘sin’ and ‘is’.

There are no examples of tense-changing auxiliaries that contradict our stemma. Figs. 159 and 160 offer tense-changing auxiliaries, but they agree with our stemma, which does not rule out that such auxiliaries might be parallelistic.

```

Figure 160. Appendix C, *Lanseloet* verses 02.0347: another example of auxiliaires changing tense.

Although the evidence is not abundant, our conclusion is that auxiliaries may be ungenealogical parallelisms. Further research will verify whether this conclusion is correct.

5.3.4.2.8. Evaluation of the Word Category Conjunctions

Appendices C and D offer many examples of parallelistic, ungenealogical conjunctions:

```

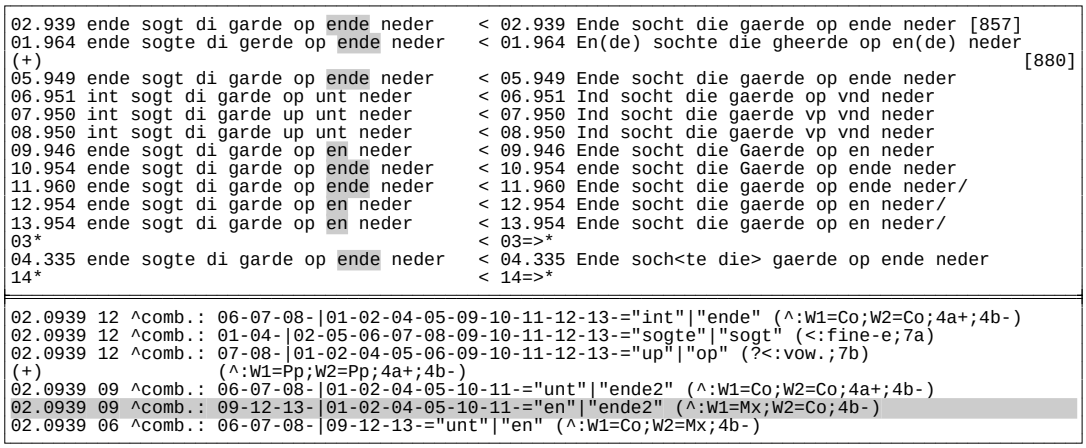
```

The medieval conjunction ‘ende’ (in English: ‘and’) gradually changed to the conjunction ‘en’, as we know and use today. Therefore, it was likely that we could find examples in which the spread of the variants ‘ende’ and ‘en’ in the *Lanseloet* text versions does not agree with our stemma. An example of such a parallelistic, ungenealogical spread of both conjunctions is presented in fig. 161: ‘en’ occurs in a group that is not a closed (text) family in the stemma.



```
02.939 ende sogt di garde op ende neder    < 02.939 Ende socht die gaerde op ende neder [857]

```

Figure 161. Appendix C, *Lanseloet* verses 02.0939: the old conjunction ‘ende’ is replaced by the modern conjunction ‘en’ in an ungenealogical way, because a group 09-12-13- is not present in our chain/stemma.

Of course, we wanted to detect other conjunctions as ungenealogical variants as well. Unfortunately, they are not present. The difference in the last letter ‘n’ between (shorthand) variants ‘don’ and ‘do’ in fig. 162 is very small. The same is true for the variants ‘ofte’ and ‘oft’ in fig. 163. We can offer many examples in

which a conjunction is added at the beginning of a verse (see verses 02.0114, 02.0490 and 02.0560). However, these interpolations all agree with our stemma.

```

```

Figure 163. Appendix C, *Lanseloet* verses 02.0673: the difference between ‘ofte’ and ‘oft’ is very small, by which it becomes difficult to draw conclusions about the parallelistic character of these conjunctions.

The conclusion at the end of this section must be stated cautiously, because we did not find clear, convincing examples to show that conjunctions are parallelistic. Yet, I am still convinced that they are parallelistic, in view of the ease with which they have been interpolated in the *Lanseloet* texts.

5.3.4.2.9. Evaluation of the Word Category Prepositions

Appendix D does not offer many examples of parallelistic, ungenealogical prepositional variants.

```
02.0128 04 ^comb.: 02-14-|12-13-="te"|"van" (^:W1=Mx;W2=Pp;4b-)
02.0185 11 ^comb.: 09-14-|01-02-05-06-07-10-11-12-13-="dan"|"vor"
                   (^:W1=Mx;W2=Pp;4b-)
02.0218 09 ^comb.: 01-04-05-|02-09-10-11-12-13-="tuwen"|"tot"
                   (^:W2=Pp;4b-)
02.0803 09 ^comb.: 13-14-|01-02-05-09-10-11-12-="ten"|"te"
                   (<:fin-n;7a) (^:W1=Mx;W2=Mx;4b-)
```

In verse 02.0128, we find examples of the fact that prepositions may change ungenealogically. The situation is pictured in fig. 164. However, this example is not totally convincing, because the grammatical quality of the verses concerned is not perfect. Furthermore, ‘te’ is used in front of a (main) verb. Actually, I hoped to find ungenealogical prepositions in front of a substantive.

Figure 164. Appendix C, *Lanseloet* verses 02.0128: an example of the ungenealogical character of the preposition ‘te’ in texts 02 and 14.

Another example of a parallelistic preposition seems to occur in verse 02.0185, as pictured in fig. 165. Yet, it is not a example of a clear prepositional ungenealogical variance. The word ‘dan’ in texts 09 and 14 is connected to ‘li(e)ver’, which makes it act like a conjunction. Nevertheless, the example shows that a preposition can change into another word in a ungenealogical way.

```
02.185 di ik wawde hebben vor sandrin        < 02.185 Die ic woude hebben voer sandrijn
(+)                                                                    [fo.-A5r-][164]

```

Figure 165. Appendix C, *Lanseloet* verses 02.0185: the (shorthand) preposition ‘vor’ has changed in an ungenealogical way into ‘dan’, because group 09-14- is not a end group in our chain/stemma.

Again we are not overwhelmed by the ‘evidence’. Nevertheless, our conclusion is that prepositions cannot be used as genealogical building tools for the *Lanseloet* tree.

5.3.4.2.10. Evaluation of the Word Category Pronouns

In §5.3.4.2.5, we discussed the pronomen demonstrativum or the article ‘die’. We saw that this pronoun/article can be parallelistic. Another example shows that an article can be easily replaced by a pronoun (or vice versa), which stresses the unsteady, parallelistic character of pronouns and articles:

```
02.977  ende ik des levens hadde en inde    < 02.977  Ende ic des leuens hadde een eynde [892]
01.1006 ende ik des levens hadde ene ende   < 01.1006 En(de) ic des leuens hadde ene ende [917]

Figure 166. Appendix C, *Lanseloet* verses 02.0977: an example of the ungenealogical character of the pronoun ‘myn’/‘mijn’ in texts 09 and 14.

It is easy to find examples in Appendix D that show that the flexion of pronouns does not have a text-genealogical value:

```
02.0142 12 ^comb.: 01-07-08-|02-05-06-09-10-11-12-13-14-="al"|"alle"
                   (<:2ch;fin-e;7a;6a) (^:W1=Mx;W2=Pn;4b-)
02.0173 11 ^comb.: 05-14-|02-06-07-08-09-10-11-12-13-="mi"|"mins"
                   (^:W1=Pn;W2=Pn;4a+;4b-)
02.0201 09 ^comb.: 06-09-10-|02-05-11-12-13-14-="elke"|"elk"
                   (<:fin-e;7a) (^:W1=Pn;W2=Pn;4a+;4b-)
02.0793 12 ^comb.: 04-11-12-13-|01-02-05-06-07-08-09-10-="al2"|
                   "alle" (^:W1=Mx;W2=Pn;4b-)
```

Even if the difference between the pronouns is more pronounced, the variants are still not (text-genealogically) trustworthy:

```
02.0110 10 ^comb.: 10-11-|01-02-05-06-07-09-12-13-="hen"|"hem"
                   (^:W1=Mx;W2=Pn;4b-)
02.0221 12 ^comb.: 07-08-11-12-13-|01-02-04-05-06-09-10-="wat"|"dat"
                   (^:W1=Pn;W2=Mx;4b-)
02.0119 09 ^comb.: 09-11-12-13-|01-02-05-10-14-="din"|"u"
                   (^:W1=Mx;W2=Pn;4b-)
```

The reason is simple. Either the context shows what the correct word must look like, which means that an error can be repaired, or the context is vague, which means that parallelistic errors can be caused. Analogously, we doubt the text-genealogical value of differences in the gender of pronouns, although there are no *Lanseloet* examples to demonstrate this. Notice that differences between the various forms of the second person singular ‘u’ and ‘dijn’ can be parallelistic as well.

The formula concerning verse 02.0110, in which the pronoun ‘hen’ (in English: ‘them’) contrasts with the pronoun ‘hem’, is interesting (see fig. 167). In the verses 02.0107 to 02.0109, the introduction to verse 02.0110 is given. These three verses say that ‘it often happened that women, who trusted the men too much...’ followed by verse 02.0110 ‘... got into grief, considered afterwards’.

```

Figure 167. Appendix C, *Lanseloet* verses 02.0110: an example of the ungenealogical character of the pronoun ‘hen’ in texts 10 and 11; probably, the medieval (masculine and feminine) plural pronoun ‘hem’ was understood as a (masculine) singular pronoun in the 16th and later centuries.

In modern Dutch, the pronoun ‘hem’ (in English: ‘him’) is only used for the masculine third person singular in the dativus or accusativus. In the Middle Ages, this pronoun was also used in the masculine and feminine plural.[191] Gradually (and therefore potentially parallelistically), the plural ‘hem’ vanished. In the grammar *Twe-spraack*, from 1584, ‘hem’ is not mentioned anymore as a plural pronoun.[192] The situation is sketched in fig. 168. The copyists or printers of texts 09 and 10 (or the forefathers of these texts) saw the old pronoun ‘hem’ in the text they copied. Independently from each other, they judged it to be an incorrect or old-fashioned word. They both changed it to ‘hen’ (see fig. 167). Since we know from our stemma that texts 09 and 10 do not belong the same family or end group, the occurrence of ‘hen’ is an ungenealogical parallelism. We learn from this example with ‘hem’, that we need at least some basic philological knowledge of the language of the text versions we study, in order to be able to understand the backgrounds of the variants.

[191] See van Loey (1976,I:§28) or van der Wal (1992:140).

[192] See Dibbets (1985:247;466).

	MALE PLURALIS		FEMALE PLURALIS	
	Dativus	Accusativus	Dativus	Accusativus
Middle Ages	hem, hen, -en	hem, hen, -se	hem, hen, -en	hem, hen, -se
Twe-spraack (1584)	hun, hunluider	hen, ze, henluiden	haar, haarluiden	ze, haarluiden

Figure 168. In the Middle Ages, ‘hem’ was used in the plural; gradually the plural ‘hem’ disappeared; it is no longer mentioned as such in the *Twe-spraack* from 1584.

There are many other possible examples that show the parallelistic character of pronouns. Furthermore, pronouns can be added or left out quite easily (see a.o. verses 02.0350 and 02.0370).

The only situation, in which a personal pronoun may be text-genealogically trustworthy, is when it is the subject of a sentence or clause. Further study should reveal if this is true. The next example (in fig. 169) shows that we must be very careful in using pronouns (even in subject position), because the pronoun ‘het’ may take the position of the pronoun ‘hi’ (or ‘si’?):[193]

```
02.672 hi is seker en mordenar              < 02.672 Hi is seker een moerdenaer [614]
01.694 hets seker en mordenar               < 01.694 Hets seker een moerdenaer [634]

Figure 169. Appendix C, *Lanseloet* verses 02.0672: an example of the ungenealogical character of the pronoun ‘het’, occurring in the ungenealogical group 01-04-05- (see also §5.3.4.2.2.).

The conclusion of this section is that we have strong indications that pronouns in the *Lanseloet* texts are parallelistic, which means that they are worthless for text-genealogical research and the development of the *Lanseloet* genealogy.

---

[193] My family speaks the dialect/language of Maastricht and Limburg, and I sometimes hear that the masculine personal pronoun ‘hem’ or ‘’m’ or the neutral pronoun ‘het’ is used to refer to a woman. The following is an example of this. My sister’s husband asked my brother when he would return a book he borrowed from *her*. He replied: ‘Iech höb *’m* dat book al trök gegeve!’, ‘I already gave the book back to *him*’.

5.3.4.2.11. Implications of the Evaluation of Characteristic 4b for the Emendatio

In §2.2, we discussed the use of a stemma as a tool to (re)construct the text of the archetypus. We saw that due to diachronical changes of language, it is very hard to determine the precise form of archetypical readings. We also introduced the

> *General rule for the reconstruction of an archetypus text:*
> A. A (relevant) reading in two or more text versions is *a common ancestor reading* of these text versions if two conditions are fulfilled:
> 1. At least two text versions show the same relevant reading.
> 2. The common ancestor is the first (and only) common ancestor of these text versions.
> B. If the first (and only) common ancestor is the archetypus, a common ancestor reading is called an *archetypus reading*.

In the previous sections, we evaluated the text-genealogical virtues of word classes. We concluded that in the case of the *Lanseloet van Denemerken* text versions only variants belonging to the word classes substantive nouns and verbs are trustworthy, text-genealogical, building elements. Suppose that we have detected that the stemma of five texts, A to E, looks like the one in fig. 170, and that texts C and E have the pronoun ‘het’ in common, while the other text versions show other pronouns.

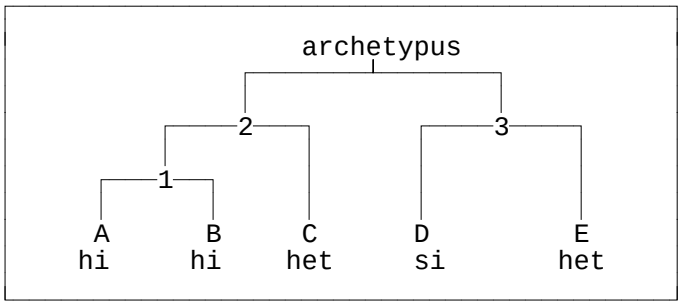

Figure 170. Does the archetypus have ‘het’?

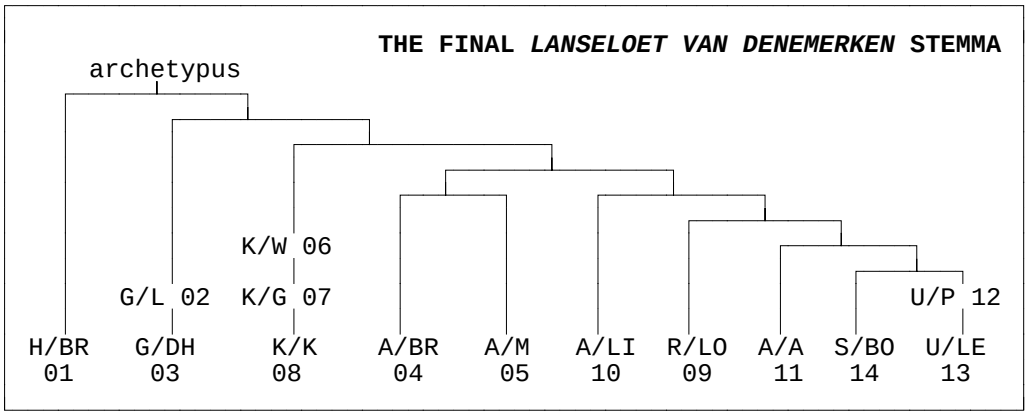
If we apply the reconstruction rule, we can say that the archetypus text must have had ‘het’. However, we saw that in the case of the *Lanseloet* texts pronouns may be parallelistic. Therefore, we imagine that the ancestor of C, the intermediate text version ‘2’ had ‘hi’, ‘si’ or even another pronoun. The same goes for ‘3’ and, eventually, for the archetypus. In other words, the archetypus reading is unclear. The reconstruction rule can only be applied in the case of trustworthy text-genealogical variants.[194] We can note that the reconstruction rule explicitly

[194] While discussing fig. 2, we discovered that one archetypus reading must have been ‘primus’. Now we know that, in the case of *Lanseloet van Denemerken* text versions, substantive nouns and verbs

mentions a ‘relevant reading’. Indeed, if ‘relevant reading’ is understood as ‘text-genealogical reading’ the reconstruction rule is still correct.

This books deals with the construction of text-genealogical trees, not with the application or use of chains and stemmas. Nevertheless, we wonder how our *Lanseloet* stemma, reprinted in fig. 111, can be used for text-critical purposes.



(Figure 111.) The final, definite stemma of *Lanseloet van Denemerken*.

First, we can still use the stemma for the (re)construction of archetypical readings, although we prefer to (re)construct text-genealogical readings, belonging to the word classes substantive nouns or verbs. If text version H/BR=01 has a text-genealogical variant in common with any other text version, we know that it is a reading occurring in the archetypus.

Second, we can use the tree to reconstruct archetypical themes or passages. If a certain theme (say the death of a person) occurs in certain texts, the stemma can reveal whether it is present in the archetypus. Admittedly, it is unclear how the theme precisely reads in the archetypus. Notice that we can use differences and agreements in *themes* to build text-genealogies (as if they were textual variants). This may be convenient if we deal, for instance, with text versions in different languages.

Third, the stemma can help us to determine the text-critical value of the *Lanseloet van Denemerken* text versions. Suppose that our stemma is correct, and that we want to produce a text-critical edition of the *Lanseloet* text. Then, we can say, that the variants of text versions K/G=07 and K/K=08 are generally (text-genealogically) unimportant, since we possess K/W=06, their ancestor. For the same reason, we may decide to leave the variants of texts G/DH=03 and U/LE=13 out of consideration. In other words, with help from the stemma we can reduce

---

are text-genealogical variants. Since ‘primus’ belongs to another word category, it is, at the least, doubtful that ‘primus’ was the archetypus reading.

(the costs of) the apparatus of variants in the text-critical edition considerably, since we can 'eliminate' the four text versions mentioned.[195]

Fourth, the stemma teaches that texts like H/BR=01 and G/L=02 are very close or similar to the archetypus. Therefore, we could decide to take one of these text versions as the base text for a text-critical edition.[196]

5.3.5. EVALUATION OF CHARACTERISTIC 5

In §3.3.1, characteristic 5 was defined as:

Characteristic 5: Text-genealogical variants can belong to other word categories when standing in rhyming position in verses.

We can keep the evaluation of this characteristic concise. If characteristic 5 did not exist, we would have missed the three variation formulas mentioned in fig. 171. Formula 04 would have been rejected because 'din' (shorthand for 'dien'; the '~' is used to denote the rhyming position of the word) is a pronoun or article. Formula 18 with 'sot' (shorthand for 'soet', in English 'sweet') would not have been accepted, because it is an adjective. The same is true for formula 40, with the prepositions 'van' and 'an'.

```
04. 02.0085 09 02-06-07-08-|05-09-12-13-14-="~din"|"~viloni" (wds
    r.p;5)
    (a. 02+06+07 have 'dien', 08 'dyn'; b. 05 has 'vilonie', 09
    'vilonie.', 12+13 'vylonie.', 14 'vylonie.'; c. 01 has
    'dorpernie', 03+04=nd, 10 has 'vileynie.' (a variant of
    'vilonie'?)
18. 02.0385 12 09-11-12-13-|01-02-03-05-06-07-08-10-="~sot"|"~spot"
    (wds r.p;5)
    (a. 09 has 'soet', 11+12+13 'soet/'; b. 01+02+03+05+10 have
    'spoet', 06+07 'spoit', 08 'spoit.'; c. 04+14=nd.)
40. 02.0991 12 07-08-|01-02-04-05-06-09-10-11-12-13-="~van"|"~an"
    (wds r.p;5)
    (a. 07+08 have 'van'; b. 01+02+04+05+06+09+10 have 'an',
    11+12+13 'an/'; c. 03+14=nd.)
```

Figure 171. Three *Lanseloet* formulas, mentioned earlier in fig. 71.

---

[195] Nevertheless, it is, of course, preferable to present the complete apparatus of variants, by which the readers are enabled to check whether, in our case, texts G/DH=03, K/G=07, K/K=08, and U/LE=13 are indeed text-genealogically unimportant.

[196] Personally, I would choose text G/L=02 as the base text version for the text-critical edition for pragmatic reasons. Often there are fewer differences between G/L=02 and the other text versions than between H/BR=01 and the other text versions. This implies, that the apparatus of variants in the text-critical edition will be smaller, if text version G/L=02 is chosen as base text.

Ungenealogical characteristic 5 formulas with variants from the forbidden word categories are not present. Of course, the absence of such formulas does not *prove* that characteristic 5 is correct. Since it has not been falsified, there is no reason to reject it. Of course, further research is necessary to evaluate it more thoroughly.[197] But that is true for all the characteristics.

5.3.6. EVALUATION OF CHARACTERISTIC 6

In §3.3.1, characteristic 6 was defined as follows:

Characteristic 6 (6a, 6b, 6c): Text-genealogical variants are not accidentals or small spelling differences.

The following textual differences are considered to be *accidental*, by which they cannot be used to build text genealogies with:

6a. Orthographical or diacritical differences.

6b. Differences in word boundaries are considered to be orthographical, and, thus, accidental.

6c. Nonsense words, obvious slips of the pen or the typesetter, or clearly incorrect, corrupt words (or word sequences that are semantically obviously incorrect) that can be changed quite easily into correct words (or word sequences).

5.3.6.1. Evaluation of Characteristic 6a, concerning Small Differences

In §4.3, we explained how the shorthand text of *Lanseloet van Denemerken* was created. We saw that the main goal of the shorthand text was to enable the computer to find good variants, unhindered by all kinds of trivial spelling differences. Arbitrarily, I use the variants of the 02.0168 verses, printed in fig. 172, to illustrate this again. The differently spelled words ‘liue’, ‘live’ and ‘lijue’ have the same form ‘live’ in the shorthand text. If the shorthand text did not exist, we could never have used formula 08 in the list of text-genealogical variation formulas (see fig. 71).

---

[197] If variants are in rhyming position, they must be treated like nouns or verbs. I want to stress that if the difference between variants in rhyming position is trivial (e.g. if it consists of a difference in flexion) these variants have to be rejected.

```

Figure 172. Appendix C, *Lanseloet* verses 02.0168: the variation formula 01-02-05-06-07-08-| 09-10-11-12-13-14- would not have been detected without the shorthand text.

There are many examples to demonstrate that agreement in punctuation and agreement in the use of capitals or small letters are parallelistic and ungenealogical. This can be shown with the 02.0988 verses, printed in fig. 173. The period behind ‘gedaen’ occurs in texts 07, 09, 10, 11, 12, 13, which is an ungenealogical group. Furthermore the word ‘want’ is written or printed in texts 07 and 14 with a small letter ‘w’. This is an ungenealogical group as well.

```

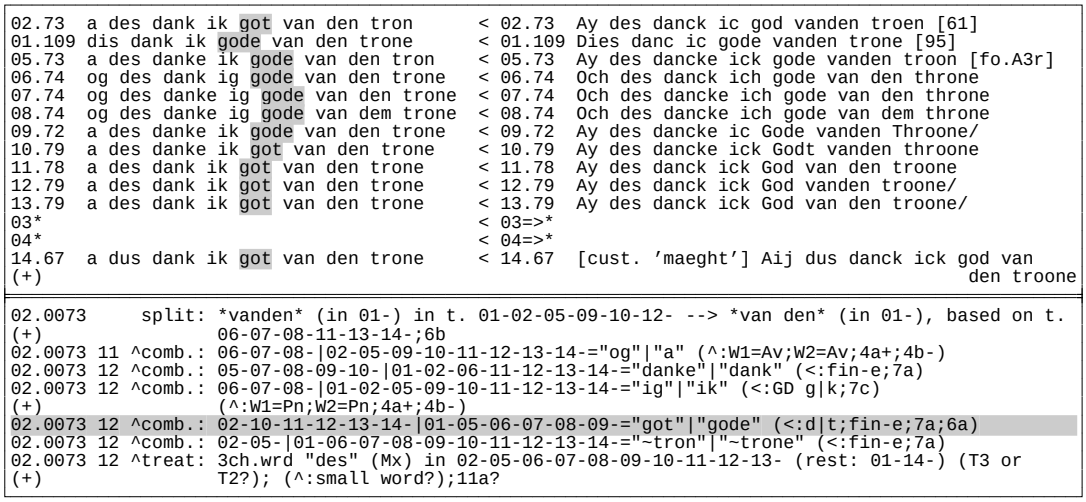
Figure 173. Appendix C, *Lanseloet* verses 02.0988: an example of the ungenealogical character of punctuation or the use of capitals or small letters.

Although in the shorthand text many trivial spelling differences vanish, it is possible that some minor variants are present. They may consist, for instance, of differences between ‘d’ and ‘t’ or the presence of the letter ‘e’. Such trivial

variants in the shorthand texts are removed by characteristic 6a. The next examples, printed in figs. 174 and 175, show that these trivial variants may be ungenealogical. Texts 02, 10, 11, 12, 13 and 14 (with shorthand variant ‘got’) do not belong to the same text family; neither do texts 01, 05 and 14 (with the shorthand variant ‘ligt’). Notice that a difference in an affix, caused by flexion (characteristic 7a), can be considered as a spelling difference as well. The software often combines characteristic 6a and 7a, as can be seen in the highlighted formula in fig. 174.



```

Figure 175. Appendix C, *Lanseloet* verses 02.0915: characteristic 6a filters out the ungenealogical variants ‘ligt’ and ‘liget’.

The conclusion of this section is that we need characteristic 6a to filter out ungenealogical parallelisms in the *Lanseloet van Denemerken* corpus.

5.3.6.2. Evaluation of Characteristic 6b, concerning Word Boundaries

In §4.3, on p. 132, we discussed how the software splits words into single words or units. If a word in a certain verse of a *Lanseloet* text consists of two or more parts in an accompanying verse of one or more other text versions, that word will be split. The *splitting* is context-driven. A word like 'int' in verse 02.0010 or 02.0100 will be split into 'in t', because that word is present as 'in t' in one of the accompanying verses of the other texts. The same word 'int' in text 01 of verse 02.0184 is not split, because the other text versions do not have 'in t'. In other words, a word like 'int' in a verse will only be divided into 'in t', if this word is divided as such in a parallel verse of another text version.

We use fig. 176 to show that differences in word boundaries can be parallelistic. In verse 02.0959, the word 'afnam' occurs as one word in texts 04, 05 and 14, and it occurs as two words 'af nam' in the other texts. The three texts do not belong to one clear family, which shows that the presence or absence of certain word boundaries may be parallelistic and ungenealogical.[198]

```
02.959 di en blom dar af nam              < 02.959 Die een bloem daer af nam [874]
01.986 di ene blome dar af nam            < 01.986 Die ene bloeme daer af nam [897]

Figure 176. Appendix C, *Lanseloet* verses 02.0959: an example of the virtue of splitting words in the shorthand text; 'afnam' occurs in the original, non-shorthand, texts as one, undivided word in the ungenealogical group 04-05-14-.

[198] Clear examples of other concatenated words in incorrect type-2 groups are: 'vanden' (in the 02.0073 verses, in incorrect type-2 group 01-02-05-09-10-12-); 'bider' (in the 02.0177 verses, in incorrect type-2 group 02-05-06-09-10-); 'vanden' (in the 02.0328 verses, in incorrect type-2 group 02-05-12-13-); 'alte' (in the 02.0422 verses, in incorrect type-2 group 05-14-); 'morgenstont' (in the 02.0679 verses, in incorrect type-2 group 01-06-07-08-10-); 'ist' (in the 02.0830 verses, in incorrect type-2 group 02-06-09-10-11-14-); 'int' (in the 02.0891 verses, in incorrect type-2 group 01-02-09-11-); 'allegader' (in the 02.1011 verses, in incorrect type-2 group 04-10-11-); 'inden' (in the 02.0114 verses, in incorrect type-2 group 02-05-06-09-10-11-14-). These examples show that word boundaries in the *Lanseloet* text versions are arbitrary and may offer false text-genealogical information.

On the other hand, if the software would not have split the concatenated words, some formulas would have been less complete. This is demonstrated in fig. 177:

```

Figure 177. Appendix C, *Lanseloet* verses 02.0488: the software splits up ‘edelvrouwe’ in text 10 into two parts; otherwise, text 10 could not have been mentioned in the highlighted formula (= formula 21 in fig. 71).

Our conclusion is that characteristic 6b is important, a.o. because it prevents us from using ungenealogical differences in word boundaries.

5.3.6.3. Evaluation of Characteristic 6c, concerning Nonsense Words, Slips of the Pen or Typograpical Mistakes

In §3.3.2, we explained that the detection of characteristic 6c has not been automated yet. Logically, the evaluation of this characteristic is difficult, since we cannot use computer output to evaluate it.

The question is when we must consider a word to be a nonsense word. Our pragmatic answer, already offered in footnotes 41, is simple. A word is a nonsense word if it does not appear in the MNW (1885-1952) or the MNHwb (1932, including the 1983 Supplement) or the WNT (1882-...). Of course these books do not cover all the possible medieval words in Dutch dialects. Nevertheless, they are an impressive and concrete source, which can be automated. We must not assume to quickly that a word is nonsense. Sometimes a close study of a word in its context may show that the word makes sense after all.

Sometimes, it is very simple to repair an evident error. For instance, the word ‘miune’ in verse 02.0204, pictured in fig. 178, can be easily repaired into ‘minne’. This reparation becomes even more simple when we realize that in the *Lanseloet* texts some printers mixed the ‘u’ and ‘n’ more than once.

```
02.204 geregte miune en hawt gen merk      < 02.204 Gherechte miune en hout gheen merc [181]
01.243 geregte minne en let gen merk       < 01.243 Gherechte mi(n)ne en ledt gheen merc [218]
05.204 geregte minne en hawt gen merk      < 05.204 Gherechte minne en houdt gheen merck
06.206 geregte lifde en hawt gin merk      < 06.206 Gherechte liefde en hout geyn merck
07.206 geregte lifde hat gin merk          < 07.206 Gerechte liefde hait geyn merck
08.206 geregte lifde hat gin mirk          < 08.206 Gerechte lieffde hait geyn myrck
09.203 geregte minne en hawt gen merk      < 09.203 Gherechte Minne en hout gheen Merc

```

Figure 178. Appendix C, *Lanseloet* verses 02.0204: the word ‘minue’ in text G/L=02 is an evident error; we may read it as ‘minne’, and add text 02 to the highlighted formula by hand.

If a word can be repaired that easily, there are no objections to using the repaired word in the variation formulas. If the reparation is more complex, or impossible, we should avoid using the incorrect word in a variation formula. Such nonsense words may have caused parallelistic changes in the texts.

Incidently, even evident errors are not always be repaired immediately, as the next formulas show (in which, incorrectly, texts 06 and 07 are a group separated from text 08):

```

                   (^:W2=Pp;4b-)
```

5.3.7. EVALUATION OF CHARACTERISTIC 7

In §3.3.1, characteristic 7 was formulated as follows:

Characteristic 7 (7a, 7b, 7c, 7d): Text-genealogical variants are not potential regional, ideolectic, diachronic or other parallelisms.
Textual differences are not genealogical when it is possible or probable that these differences are parallelistic. Apart from the accidental (orthographical) parallelism, mentioned here as characteristic 6, we know four other, not strictly monolithic, *types of parallelism*: inflectional parallelism (‘is’ - ‘was’); synonymous and idiolectic parallelism (‘white’ - ‘pale’); regional parallelism (‘color’ - ‘colour’); diachronic or historical parallelism (see §3.2.1). To minimize the danger of parallelism, we formulate (c.q. have formulated in §3.3.1) the following rules:

7a. The differences between genealogical variants cannot be mere differences in inflection. Therefore, the variants are converted into original *kernels* or *roots* (i.e., uninflected *basic lexical forms*, ignoring their gender, number,

inflection and affixes), which can be found as *lemmas* or *entries* in dictionaries. Inflected word forms easily take other forms (e.g. ‘was’ - ‘has been’; ‘have’ - ‘had’). If we would use such word forms as genealogical variants, the danger of inflectional parallelism would be too great. (Source: sixth hypothesis; §3.2.1: the types of parallelism.)

7b. The difference between variants or their roots / kernels must not merely be a (phonetic) difference in a *range of vowels*. (See note 81). Textual differences that consist of mere differences in vowels always carry the danger of parallelism within them and can better be disregarded as text-genealogical variants. We are interested in substantial, heavy (non-trivial or non-accidental) textual differences with nearly undisputed text-genealogical power!

7c. The differences between variants cannot be mere differences between the different vocabularies of languages or dialects. All the variants must be words that are *generally known* in the languages or dialects of the text versions. This characteristic is mentioned to prevent regional, idiolectic and diachronic parallelisms (see §3.2.1); when variants are caused by differences in *languages* or dialects, they do not provide dependable genealogical information.

7d. The (cores of the) variants must be *rare*, in the sense that it is not likely that a variant can be easily interchanged with another variant. This rule attempts to prevent the use of synonymous parallelisms (see §3.2.1), like for instance variants of *names* (see footnote 82) of well-known people or things. Some *common* words can be easily turned into other more or less synonymous words, especially words that express an assertive act, like ‘say’, ‘speak’, ‘tell’, ‘il fait’, ‘il dit’ or words that are names. (See footnote 83).

5.3.7.1. Evaluation of Characteristic 7a, concerning Inflection

After discussioning the casus system and flexion in §5.3.4.2.4, we saw that the flexion of articles, auxiliaries and pronouns, can be parallelistic. Therefore, we can evaluate characteristic 7a rather quickly; inflection may be parallelistic. Nevertheless, we offer here some extra examples that show that differences in prefixes or differences in suffixes like (final) ‘-e’, ‘-en’, ‘-n’ and ‘-t’ are indeed parallelistic in the *Lanseloet* text versions. The examples demonstrate that these differences can occur in groups that are not end groups or families in the *Lanseloet* tree.

5.3.7.2. Evaluation of Characteristic 7b, concerning Differences in Vowels

We can easily demonstrate that differences in vowels are parallelistic in the *Lanseloet* text versions, using the output mentioned in Appendix D, chapter 7. Some parallelistic, ungenealogical formulas from that chapter are printed below. We use two ways to express in a formula that the difference between the variants is a difference in vowels. The first way is ‘(?<:vow.7b)’ and the second way ‘(<:e|1vow.;7b)’. ‘(?<:vow.7b)’ says that the difference between the variants is a difference between two vowels, while neither of the vowels is an ‘e’. The question mark shows that when I developed the software I had doubts as to whether or not such differences could be parallelistic. ‘(<:e|1vow.;7b)’ expresses that the difference between the variants is a difference between an ‘e’ and another vowel. In the past, I thought that it was possible that a difference between variants concerning a schwa (most often written with an ‘e’) behaved text-genealogically differently from variants concerning other vowels. Now, I have no good reason to maintain this assumption.[199]

---

[199] Few examples can be found with differences between a schwa and another vowel:

```
   02.0625 11 ^comb.: 02-05-06-07-08-|01-09-10-11-12-13-="~aventure"|"~avonture"
                    (<:e|1vow.;7b) (wds r.p;5)
   02.0648 09 ^comb.: 02-07-08-|01-05-06-09-10-11-="~aventure"|"~avonture"
                    (<:e|1vow.;7b) (wds r.p;5)
   02.0886 11 ^comb.: 02-05-06-07-08-|01-09-10-11-12-13-="~aventuren"|"~avonturen"
                    (<:e|1vow.;7b) (wds r.p;5)
```

A small selection of the large corpus of ungenealogical vowel variants:

```
02.0008 13 ^comb.: 02-06-07-08-14-|01-04-05-09-10-11-12-13-="dat"|
                   "dit" (?<:vow.;7b) (^:W1=Mx;W2=Mx;4b-)

```

At the end of this section, dealing with the parallelistic character of vowel variants in the *Lanseloet van Denemerken* text versions, I must prevent a misunderstanding. When I speak of the differences in the vowels used in variants, I mean the different possible spellings of the same word. It is possible, although I did not observe it in the *Lanseloet* texts, that the difference between truly different words, consists of a vowel. For instance, the two modern English words ‘part’ and ‘port’ have different vowels. However, both words have a totally different meaning, and cannot be traced back to the same root word / kernel. Such vowel variants, concerning different words may be genealogical, do not fall under characteristic 7b.

5.3.7.3. Evaluation of Characteristic 7c, concerning (Personal) Vocabularies

The computer was only programmed to recognize some *German* or *Ripuarian* peculiarities. Therefore, the computer knows that typically German variants may be regional and, therefore, parallelistic. Here are some formulas that demonstrate its knowledge, taken from Appendix D, §7.3:

---

shows that the difference between a schwa (I guess the ‘e’ behind the ‘v’ is a schwa) are ungenealogical. Often it is difficult to determine whether an ‘e’ is a schwa.

```
02.0009 13 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-="ig"|
                   "ik" (<:GD g|k;7c) (^:W1=Pn;W2=Pn;4a+;4b-)
02.0017 13 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-=
                   "spregen"|"spreken" (<:GD g|k;7c)
02.0241 10 ^comb.: 06-07-|01-02-04-05-09-11-12-13-="slafen"|"slapen"
                   (<:GD f|p;7c)
02.0036 13 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-=
                   "~tsongen"|"~tongen" (<:GD (t)s|t;7c) (wds r.p;5)
02.0167 12 ^comb.: 06-07-08-|01-02-05-09-10-11-12-13-14-="hertse"|
                   "herte" (<:GD (t)s|t;7c)
```

The intention of characteristic 7c is clear. Every German copyist will transcribe ‘Ich’ (or a variant of it) when his Dutch source has the personal pronoun ‘ik’. Therefore, German text versions often share typically German words, even when these texts are not genealogically related. In the case of the *Lanseloet* texts, we find several hundred variation formulas in which the (shorthand) pronoun ‘ig’ in the Cologne texts 06, 07 and 08 is a variant of the (shorthand) pronoun ‘ik’ in the Dutch and Flemish texts. These variation formulas carry the danger of parallelism and should not be used for text-genealogical purposes. Therefore, they are correctly rejected or filtered out by characteristic 7c (although texts 06, 07 and 08 are a good end group).

The same is true for variants caused by differences in the Dutch (and Flemish) dialects. For instance, a printer in Antwerpen may have the same ideas about the gender (etc.) of a substantive as his colleague in the same town. Then, it is possible that the same gender of a substantive in the text versions created by both printers, is caused by the fact that they both came from Antwerpen, and not because they worked with closely related sources. In §5.3.4.2.2, we considered an alternative *Lanseloet* stemma in which texts A/BR=04 and A/M=05 were contaminated with text H/BR=01. Perhaps, the agreement in variants of texts 04 and 05, printed in Antwerpen, and text 01, written in Brabant, was caused by regional parallelism? If dialect or phonetic atlases covering the period of 1400 to 1700 existed, regional parallelisms could be recognized more easily. Unfortunately, such atlases are not available. We hope that the atlases of Berteloot (1984) or Dees (1980 and 1987) will inspire others to produce atlases covering Middle Dutch and more modern Dutch language and dialects.[200]

The conclusion of this section is simple, although it is not based on (text-genealogical) facts delivered by the computer: we must avoid the use of regionally bound variants.

---

[200] Berteloot (1984) covers the sounds of thirteenth-century Middle Dutch. Dees (1987) deals with linguistic ‘formes’ in old French literary texts.

5.3.7.4. Evaluation of Characteristic 7d, concerning Frequently Used Words and Names

This characteristic cannot be evaluated properly, because the computer output only concerns a part of characteristic 7d, namely the (proper) names of persons in the *Lanseloet van Denemerken* texts.

Every copyist has a certain knowledge of the world, history, famous persons, etc. This knowledge may play a role during his copying activities. If he comes across, for example, the name of a saint like Saint John, and if there are two or more possible spellings for this name (i.e. in Dutch 'Johan(nes)' and 'Jan'[201]), the copyist may write the name as he knows it, independent from the source. Therefore, the use of (famous) names in text versions may be parallelistic. The following examples show that the use of names in the *Lanseloet van Denemerken* texts may be ungenealogical:

```
02.0043 11 ^comb.: 01-14-|04-05-06-07-08-09-11-12-13-="sanderin"|
                   "sandrine" (^:names with > prox. 0.87;7d)
02.0224 13 ^comb.: 01-10-11-12-13-14-|02-04-05-06-07-08-09-=
                   "~simon"|"~simeon" (<:e;?;6a) (wds r.p;5)
                   (^:names with > prox. 0.90;7d)
02.0257 11 ^comb.: 02-04-10-|05-06-07-08-09-11-12-13-="lantslot"|
                   "lanslot" (^:names with > prox. 0.93;7d)
```

At the end of §5.3.7.2, I warned that differences between vowels of variants are parallelistic, only if these variants go back to the same root word. Analogously, I must warn that especially variant forms of the same name carry a large danger of parallelism. However, if the variants concern different names of different people (say 'Jesus' and 'mary'), and both different names fit well in the texts and are not in conflict with the common knowledge about the people concerned, the variants may be used as genealogical variants to build trees with.

A part of characteristic 7d states that text-genealogical variants cannot be common, (highly) frequently used words. The idea behind it is that common words can be replaced (or left out or added) quite easily. Common words with a closely related meaning seem to carry the danger of being interchangeable and, therefore, of being parallelisms. Examples of such interchangeable words are 'woman', 'lady' and 'girl', or 'say', 'tell' and 'speak'. However, we did not find indications that such parallelistic changes did occur in the *Lanseloet van Denemerken* texts. In §5.3.4.2.3, in which the word category adverbs was evaluated, we saw that frequently used words like 'so', 'also', 'o', 'och', 'nie' and 'noyt' can be parallelistic variants. It is difficult to determine the precise reason why they are parallelistic. Is it only because they are adverbs? Or is it because

[201] Both variants occur in the 02.0262 verses (see fig. 50), but the variants do not occur in ungenealogical groups.

they are frequently used words? Or is the reason that they are short words? Or is it a combined reason, e.g. because they are short adverbs? Et cetera.

The conclusion of this section is that in the *Lanseloet* corpus variants of the same names (referring to the same persons) cannot be used for text-genealogical research. Future research must show or confirm whether common, frequently used words are parallelistic.

5.3.8. EVALUATION OF CHARACTERISTIC 8

In §3.3.1, we formulated characteristic 8 as follows:

Characteristic 8: Text-genealogical variations in word order.
A difference in a syntactically adequate *word order* must be considered as a genealogical variation as long as the difference in word order does not merely concern a different placement of an adverb in a verse or sentence.

In §3.2.6, I mentioned that Dr. M. van Mulken warned that a change in word order can be parallelistic. I partly agreed with her. Therefore, I added the part ‘as long as the difference in word order does not merely concern a different placement of an adverb in a verse or sentence’ to the characteristic.

When we look at the output in chapter 8 of Appendix D, we see that the added restriction concerning adverbs worked well. The adverb part enabled characteristic 8 to filter out the following ungenealogical variation formulas.

```
02.0017 10 ^obs01: 02-04-05-09-10-|01-11-12-13-14-: W.O "spreken"-
                   "altos" (T2);8; (^:W1or2=Av;8)
02.0144 09 ^obs02: 01-02-14-|05-09-10-11-12-13-: W.O "nit"-"mi"
                   (T2);8; (^:W1or2=Av;8)
02.0151 11 ^obs02: 01-05-|02-06-07-08-09-11-12-13-14-: W.O "nit"-
                   "haven" (T2);8; (^:W1or2=Av;8)
02.0151 11 ^obs03: 01-05-|02-06-07-08-09-11-12-13-14-: W.O "nit"-
                   "van" (T2);8; (^:W1or2=Av;8)
02.0701 12 ^obs01: 01-02-05-06-07-08-|04-09-10-11-12-13-: W.O
                   "hadde"-"wel" (T2);8; (^:W1or2=Av;8)
```

Notice that the last variation formula would have arranged the closely related texts 04 and 05 into two different (ungenealogical) families. However, the introduction of the element about adverbs in the word order rule is not sufficient to get the word order rule working correctly. Appendix D offers us examples that show that characteristic 8 still does not work optimally. We will study the following variation formulas in their context:

```
02.0397 09 ?obs01: 09-10-11-|02-03-06-07-12-13-: W.O "op"-"is"
                   (T2);8;
02.0403 08 ?obs01: 08-12-13-|02-03-05-09-11-: W.O "here"-"got"
                   (T2);8;
```

```
02.397 dar min herte is op gestelt         < 02.397 Daer mijn herte is op ghestelt [358]

```

Figure 179. Appendix C, *Lanseloet* verses 02.0397: a first indication that characteristic 8 on word order is incorrect.

If we say that ‘is’ and ‘es’ are more or less the same words, and that the word ‘up’ in text 08 is more or less the same word as ‘op’, the word order observation can be adapted:

```
02.0397 09 ?obs01: 01-09-10-11-|02-03-06-07-08-12-13-: W.O "op/up"-
                   "is/es" (T2);8;
```

The detected group ‘(01-)09-19-11-’ is not a genealogical end group that can be found in the *Lanseloet* tree. Apparently, a preposition like ‘op’ (linked to the verb ‘gestelt’) can easily take several positions in a sentence. We conclude that not only adverbs, but also prepositions (and maybe other word categories as well?) can move throughout a sentence, implying the danger of parallelism.

We can use this new observation to adapt or improve characteristic 8. We could claim, for instance, that in the Dutch language and dialects there is a category of *free movers*, consisting of adverbs and prepositions linked to verbs. This new category is not as *ad hoc* as it first seems. Remember, that the adverb element was added in the rule because we thought that adverbs were the only elements that could take a relatively free position in a sentence. Now, it turns out that other elements, like certain prepositions, have the same capability. An extension of the category ‘adverb’ to ‘free mover’ is in the spirit of the rule. Another possibility to adapt characteristic 8 is to say that it may be applied only to substantives and verbs.

The replacement of the element ‘adverb’ in characteristic 8 with ‘free mover’, still does not solve all the problems with our word order rule. This is demonstrated by our second example in fig. 180, in which two substantives ‘here’ (English: ‘lord’) and ‘got’ take over each other’s position.

```

Figure 180. Appendix C, *Lanseloet* verses 02.0403: a second indication that characteristic 8 on word order is incorrect.

Texts 08-12-13- do not belong to the same family or end group, even though they have the same word order ‘here got’. Notice, by the way, that the word ‘got’ is not present in texts 06 and 07, the presumed forefathers of text 08. Apparently, the printer of text 08 (or a non-delivered forefather of it) reintroduced the word ‘got’ into the text based on knowledge of the world, as mentioned in §5.3.7.4. Of course, one could argue that the words ‘here’ and ‘got’ are a special case, because they are substantives that frequently occur in combination. Nevertheless, it is still a fact that the ungenealogical group 08-12-13- has these words in the same order.

We see that the position of characteristic 8 is becoming weaker.

Van der Wal (1992:164-166) offers the final blows to characteristic 8. First, she points out that the gradual loss of casus and flexion in Middle Dutch (also mentioned in §5.3.4.2.4), affected the word order, making it less flexible. If a language has a clear casus system, we can derive the syntactic function of a word (group) by looking at its casus or flexion. When the casus system gradually vanishes, it becomes more necessary to give syntactic units specific positions in a sentence. In other words, van der Wal shows that in the Middle Ages, the word order gradually became more fixed. Variances in word order in the *Lanseloet* texts, therefore, may have been caused by this general movement towards a stricter word order. Agreements and disagreements in word order of the various text versions may have been the result of this extra-textual tendency. Thus, differences in word order carry the danger of being parallelistic. There is, perhaps, one exception. Perhaps, if the text versions date from about the same time and were written in about the same region in about the same dialect, agreements in word order may provide trustworthy text-genealogical information.

Second, van der Wal (1992:160) points out that modern Dutch has a SVO-order in main clauses - the *S*ubject is placed before the *V*erb, which is placed before the *O*bject -, but an SOV-order in subordinate clauses. The Middle Dutch language/dialects had a SVO-order in both types of clauses. This implies a (gradual) change from strictly SVO in the Middle Ages to SVO/SOV in modern days. Therefore, changes in word order in the *Lanseloet* texts from 1400 to 1700, may have been caused by the general change of word order in Dutch. Again, we see that differences in word order carry the danger of being parallelistic.

Based on the counterexamples and on theoretical considerations, we must conclude that characteristic 8 cannot be maintained in the case of the *Lanseloet van Denemerken* text versions. We conclude that there are strong indications that word order is a false text-genealogical informant. Future research must show whether *word order* is a untrustworthy characteristic in the case of other text corpora as well. If so, we can definitively reject differences in word order as variants for building text-genealogical trees.

5.3.9. EVALUATION OF CHARACTERISTIC 9

In §3.3.1, characteristic 9 was formulated as:

Characteristic 9: In verses, rhyming conventions must be obeyed.

9a. When text-genealogical variants are part of rhyming texts and are in rhyming position, they have to *obey (at least assonant) rhyming conventions*. (Source: first rule, element ‘fits well and inconspicuously’.) If they violate them, this may be due to the interpolation/omission of one or more verses. Such a deletion/addition can be genealogically important.

9b. A special case of the violation of rhyming conventions occurs when one verse ends with a certain rhyming word and the immediately following verse ends with the same word. The philologist must study these verses with *duplicate rhyming words* closely, because it is very likely that these verses or the surrounding verses contain an error which occurred during the transmission process.

5.3.9.1. Evaluation of Characteristic 9a, concerning Rhyming Conventions

Like other characteristics, characteristic 9a must help us to discard information that is not text-genealogical. It works in combination with characteristic 5, which deals with words in rhyming position. Browsing through chapter 9 of Appendix D, we find two incorrect, ungenealogical variation formulas, which have been discarded (‘^comb’) by characteristic 9.

```
02.0492 11 ^comb.: 01-11-12-13-|02-05-06-07-08-09-10-="~rip"|"~rit"
                   (wds r.p;5) (conventions pure rhyme violated;9a)
02.0449 11 ^comb.: 06-07-|01-02-05-09-10-11-12-13-14-="~besugen"|
                   "~besuren" (wds r.p;5) (conventions pure rhyme
                   violated;9a)
```

This demonstrates the importance of characteristic 9a. Therefore, we already can conclude that we can maintain it.

Characteristic 9a also helps to discard ungenealogical variation formulas:

```
02.0129 11 ^comb.: 02-08-14-|01-05-06-07-09-11-12-13-= "~brengen"|
                   "~bringen" (<:e|1vow.;7b) (wds r.p;5)
                   (conventions pure rhyme violated;9a)
02.0416 10 ^comb.: 07-08-09-10-|01-02-06-11-12-13-="~stont"|"~stot"
                   (<:n;?;6a) (wds r.p;5) (conventions pure rhyme
                   violated;9a)
02.0747 07 ^comb.: 06-07-|01-02-04-05-08-="~gulden"|"~guldin"
                   (<:e|1vow.;7b) (wds r.p;5) (conventions pure
                   rhyme violated;9a)
02.0957 13 ^comb.: 08-10-14-|01-02-04-05-06-07-09-11-12-13-=
                   "~stont""|~stot" (<:n;?;6a) (wds r.p;5)
                   (conventions pure rhyme violated;9a)
02.0978 12 ^comb.: 06-07-08-14-|02-04-05-09-10-11-12-13-="~wende"|
                   "~winde" (<:e|1vow.;7b) (wds r.p;5) (conventions
                   pure rhyme violated;9a)
```

However, these formulas do not really demonstrate the virtue of characteristic 9a, because without this characteristic the five formulas would have been rejected by characteristics 7b and 6a.

Because we discuss matters dealing with rhyme in this section, we must look at another observation concerning rhyme. When the rhyme scheme of verses is violated, we can sometimes derive directional information from the violation,[202] with which we can transform the chain into the stemma. For instance, we often see that the rhyme scheme has been violated in the Cologne texts (06-07-08-) in such way that we can retrace them to a Dutch forefather. Often a ‘mir’ versus ‘mi’ variation formula occurs, for instance in verse 02.0229 (see also fig. 190 on p. 291):

```
02.0229 12 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-="~mir"|
                   "~mi" (?<:affix(es)?;7a) (wds r.p;5) (conventions
                   pure rhyme violated;9a)
```

If the German texts would have had ‘mi’ instead of ‘mir’, the rhyme would have been perfect. But ‘mi’ was impossible in the German texts, for the simple reason that ‘mi’ is not a German word or pronoun.

---

[202] As mentioned in §2.5.2 and in notes 59 and 165, a variant is directional if it provides information about the way a chain can be rooted or directed into a stemma.

It is also interesting to see that the Cologne texts seem to prefer the word ‘liefde’ above ‘minne’, which we discussed in note 117 (see also figs. 49 and 52). Appendix D, §12.2.1.1, offers about thirty examples of this preference. However, when a word like ‘minne’ (or ‘mint’) is in rhyming position, it is difficult to replace it, because the rhyme cannot be broken. We find examples of the survival of ‘minne(n)’ or ‘mint’ in rhyming position in the Cologne texts in verses 02.0084, 02.0575 and 02.0992.

The variation formula:

```
02.0665 10 ^comb.: 06-07-08-|01-02-09-10-11-12-13-="~lifden"|
                    "~minnen" (wds r.p;5) (conventions pure rhyme
                    violated;9a)
```

draws our attention. Let us take a look at the context of this formula, as presented in figs. 181 and 182.

```
02.665 ende al ut gerehter minnen          < 02.665 Ende al wt ghereehter minnen [607]
01.687 ende al ut regter minnen            < 01.687 En(de) al wt rechter mi(n)nen [627]

```

Figure 182. Appendix C, *Lanseloet* verses 02.0666: verses following verses 02.0665 (see previous fig. 181).

It is clear what happened. The forefather of the Cologne texts 06, 07 and 08 had ‘minnen’ in verse 02.0665, which formed an assonant[203] rhyming pair with ‘vinden’ in the next verse. The replacement of ‘minnen’ with the preferred word ‘liefden’ caused the break in the rhyme scheme. Notice that verse 05.0674 in fig. 181 has ‘mninen’, which is an evident error that can be easily repaired.

5.3.9.2. Evaluation of Characteristic 9b, concerning Duplicate Rhyming Words

This characteristic acts as a warning to the philologist. When the rhyme scheme is violated because two verses end with the same word, the violation is not always genealogical. It is up to the philologist to consider the text-genealogical virtues of the variation place concerned. This can be demonstrated with two observations, to be found in Appendix D, chapter 9:

```
02.0232    ?obs02: the pair (~genog - ~genog) of texts 07-09-11-12-
                   13- near 02.232 consists of duplicate
                   words;T2?;9b
02.0233    ?obs02: the pair (~genog - ~genog) of texts 07-09-11-12-
                   13- near 02.232 consists of duplicate
                   words;T2?;9b
```

[203] My software is too strict in determining whether verses rhyme. At the moment, it does not accept assonant rhyme, a bug which can be repaired quite easily. For example, it finds that the word ‘vinden’ of verse 02.0666 does not rhyme with the word ‘minnen’, or that the word ‘ellende’ of verse 02.0551 does not rhyme with ‘inde’. However, this strict attitude towards rhyme of the software did not lead to the rejection of genealogical formulas (as I checked out).

Notice, furthermore, that errors sometimes may have a long life; it is remarkable that at verse 02.0079 all the *Lanseloet* text versions violate the rhyme scheme.

```

Figure 184. Appendix C, *Lanseloet* verses 02.0233: verses following verses 02.0232 (see previous fig. 183).

The double occurrence of the (shorthand) rhyming word ‘genog’ is caused by the letter ‘u’ being turned 180 degrees, which makes it look like an ‘n’. As we saw in §5.3.6.3, when we discussed the word ‘miune’ (see fig. 178), this special error occurs frequently in the printed *Lanseloet van Denemerken* text versions. Therefore, it is possible that it pops up in different, unrelated text versions. In other words, when variants are caused by an upside down ‘u’ or ‘n’, the danger of parallelism is present. Furthermore, copyists or printers can easily emend such an erroneous ‘u’ or ‘n’, which points again to the danger of parallelism. Therefore,

we will not use this variation formula. Notice that the turning of the ‘u’ to an ‘n’ in fig. 183 occurred twice, independent from each other: once in the area of the family or forefather of text 07 (and 08), and once in the area of texts 11, 12, 13 and, possibly, 14. This is a good example of actually existing parallelism, because text 07-(08-)11-12-13-(14) are not a family or end group.

We conclude that the occurrence of duplicate rhyming words must be judged by the philologist, because the violation of the rhyme scheme can be ungenealogical or genealogical. For this judgement, we can use the first text-genealogical basic rule (see p. 64): if the variants fit well and unconspiciously it is likely that they have good survival chances, which makes them genealogical and useful for the development of text-genealogical trees. If, on the other hand, it is likely that the variants can easily be changed into each other, they are not genealogical.

5.3.10. Evaluation of Characteristic 10

In §3.3.1, characteristic 10 was formulated as follows:

Characteristic 10: Inversion of verses.
The *inversion* of (rhyming words in) verses is genealogical informative when these verses fit well in the text.

It is hard to evaluate this characteristic, because it only occurred once in type-2 environments in the *Lanseloet van Denemerken* texts:

```
02.0746 11  obs01: 09-10-11-12-13-|02-04-05-06-07-08-: rhyming pair
                   (~sandrin - ~guldin) of text 02 (near 02.746) is
                   inverted in texts 09-10-12-12-13- (T2);10
```

Notice that we integrated into this formula the fact that text 01 has ‘sanderin’. This resulted in the adapted, expanded formula:

```
02.0746 12  obs01: 09-10-11-12-13-|01-02-04-05-06-07-08-: rhyming
                   pair (~sandrin - ~guldin) of text 02 (near
                   02.746) is inverted in texts 09-10-12-12-13-
                   (T2);10
```

Although characteristic 10 occurs only once in a type-2 environment, I am convinced that it is a very important characteristic, leading to (almost) indisputable text-genealogical information. Others may judge this as optimism on my part, based on nothing. I repeat that characteristic 10 is a hypothesis, which holds as long it as has not been falsified. This characteristic must be tested further in the future.

5.3.11. EVALUATION OF CHARACTERISTIC 11

In §3.3.1, we defined characteristic 11 as:

Characteristic 11 (11a & 11b): Addition and omission of words and verses.

11a. The *addition* (or *interpolation*) and *omission* of *words* is genealogically informative when these words fit well or offer no crucial information. Notice that the presence or absence of small frequently used words (like 'so') does not give text-genealogical information.

11b. The *addition* (or *interpolation*) and *omission* of complete *verses* is genealogically informative when these verses fit well or offer no crucial information.

The computerized detection of both characteristics is discussed in Appendix B, §III.b.4.1 and §III.b.4.2.

5.3.11.1. Evaluation of Characteristic 11a, concerning Added or Missing Words

In general, it seems that omissions and additions of words are in agreement with the *Lanseloet* stemma presented in fig. 111.

Before we look at some examples of the deletion and addition of words (in figs. 185 to 188), I want to make a general remark about these phenomena. I recall that when we are developing a chain, it is not necessary to know whether a word is added or omitted. Once we have generated a stemma from a chain, this can become clear. In fig. 185, for instance, texts 01 and 02 have 'swighen' (= 'to be silent'). If we look at the position of both texts in the stemma, we see that the archetypus is their common ancestor. We conclude that the archetypus must have had the verb 'swighen' as well. Logically, texts 09-10-11-12-13-, without 'swighen', have the unoriginal or 'unarchetypical' reading. Later on in this section, we will use figs. 188 and 189 to visualize how the stemma can help us detect (un)archetypical variants.

Fig. 185 and the stemma in fig. 111 demonstrate that the group of texts 09-10-11-12-13- with the omission of the (shorthand word) 'swigen' - this verse was not delivered in text 14 - is in agreement with our stemma.

Figure 185. Appendix C, *Lanseloet* verses 02.0242: an example of the genealogical character of omission/addition of words.

Another example of the removal of a word is in the 02.0132 verses, as pictured in fig. 186. The verb ‘scheyden’ (in several forms) is not present in texts 11-12-13-14-. These four texts are an end group or closed family in the stemma, sharing one unique common ancestor.

```

Figure 186. Appendix C, *Lanseloet* verses 02.0132: another example of the genealogical character of omission/addition of words.

In fig. 187, we offer an example of the addition of a word. We see that texts 04-05-09-10-11-12-13-14- have the added word ‘over’ in common. This addition agrees with the stemma. The stemma shows that the group is a completely closed family (i.e. with one unique common ancestral node).

```

```

Figure 187. Appendix C, *Lanseloet* verses 02.0009: the omission/addition of the shorthand word ‘over’ is in agreement with our chain/stemma.

So far, the additions and deletions of words follow the family pattern(s) as expressed in the stemma. However, we must be careful in drawing our conclusions. The 02.0118 verses (see fig. 188) show that the addition of ‘over’ is parallelistic and does not completely correspond with the families in the stemma.

```

```

Figure 188. Appendix C, *Lanseloet* verses 02.0118: now the omission/addition of the shorthand word ‘over’ is not in agreement with our chain/stemma.

Let us use the stemma in fig. 189 to discuss the parallelistic occurrence of ‘over’ as expressed in fig. 188. Notice that in fig. 189 the occurrence or absence of ‘over’ has been made visible in the stemma; the word is present in texts 05-09-10-; it is absent (‘@’) in 01-02-06-07-08-11-12-13-14-; the readings of texts 03-04- have not been delivered (‘?’); some intermediate nodes are labelled as ‘t’, ‘u’,

'v', 'w', 'x', 'y' and 'z' in order to facilitate discussion. Since 'over'[204] is not present in texts 01 and 02, we assume that this word was not mentioned in the archetypus either. Therefore, the occurrence of 'over' in texts 05-09-10- is considered to be an addition.

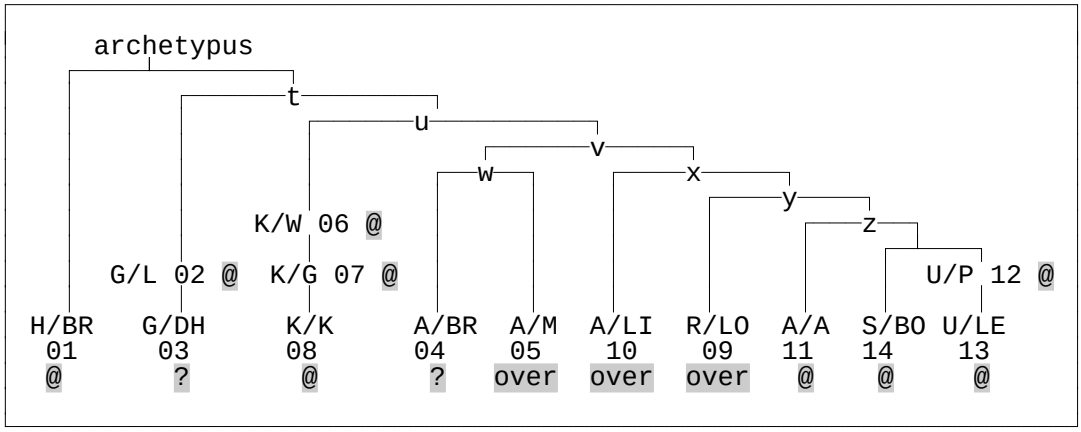

Figure 189. The stemma of *Lanseloet van Denemerken*, emphasizing the presence of the word 'over' in the 02.0118 verses (see previous fig. 188).

We wonder in which ancestral common node the word 'over' was added. It seems likely that 'over' was present in ancestors 'v', 'w', 'x' and 'y', and that it was absent in the archetypus, 't', 'u' and 'z'. Somewhere after 'u' and before (or even in) 'v' the word was introduced, and somewhere after 'y' and before or in 'z' it vanished. Logically, we must accept that at a certain point 'over' was added and at another point it disappeared again. Apparently, 'over' is a kind of unsteady word with which copyists could arbitrarily play. If this is correct, as I believe, we imagine that this word can appear and disappear almost unpredictably on the lines of descendance in the stemma. Therefore, it cannot be excluded that 'over' was present in, for instance, the archetypus text, and that it parallelistically disappeared from the line between the archetypus and text H/BR=01 and from the line between the archetypus and text G/L=02. This implies that many analyses of the occurrence of 'over' in the texts are theoretically possible and that we must be very careful in reconstructing parallelistic words in the lost original text.

As mentioned in footnote 52, Dain (1949/1975:48) warned us that short words have the astonishing tendency to disappear:

---

[204] Notice that in fig. 188 the word 'over' is labelled as a 'Pp', a preposition, because it is mentioned as such in the computer thesaurus. This leads to an incorrect analysis. 'Over scoon' means 'exceptionally/extremely beautiful'. As discussed in §3.2.6, §4.1, §5.3.4, §5.3.4.1 and in §III.a.4 of Appendix B, the word-oriented thesaurus is handicapped. However, it correctly detected that 'over' is not a substantive or a verb.

> ‘Les termes courts, et surtout ces petits mots qui constituent les «utilités» de la phrase - liaisons, conjonctions, particules, prépositions - ont une tendance étonnante à disparaître sous la plume des copistes (...)’.

If short words disappear that easily, an agreement in the absence of short words can be parallelistic. For that reason we included the passage ‘Notice that the presence or absence of small frequently used words (like ‘so’) does not give text-genealogical information’ in our definition of characteristic 11a.

Apparently, Dain did not find it necessary to define the notion ‘petit mot’ or ‘short word’. If we want to enable the computer to find ungenealogical short words, two questions must be solved: 1. Does an ungenealogical short word belong to a certain word category? 2. How big is short, or, how many characters does a short word have? To answer the first question; I interpret Dain’s ‘mots qui constituent les «utilités» de la phrase’ as ‘words which play a supporting role in a sentence’. With §3.2.6 in mind, it will not come as a surprise that I am convinced that ungenealogical short words can belong to all kinds of word categories, but not to the main word categories of sentences: nouns, verbs and, perhaps, adjectives. These categories do not play a supporting role but a main role in a sentence. The answer to the second question, about the size of short words, is difficult to determine. Short is a relative notion. I simply decided to teach he software that a small (shorthand!) word is a word with three or fewer characters. In other words, I defined, rather arbitrarily, a short word as a word consisting of three or fewer phonemes.

Let us evaluate this size of small words of three or fewer characters. The examples in figs. 190 to 194 demonstrate that the addition or deletion of small words in the *Lanseloet* texts carries the danger of parallelism.

Figure 194. Appendix C, *Lanseloet* verses 02.0805: the presence of the small word ‘die’/‘den’ in texts 01-14- is ungenealogical.

In fig. 188, we were confronted with the problem of the addition of the word ‘over’. This shorthand word has four characters or phonemes. Therefore, the software did not consider it to be a small word (of three or fewer phonemes). Other examples of parallelistic words with four characters can easily be found in the *Lanseloet* corpus, for instance in the 02.0655 verses, as pictured in fig. 195:

```
02.655 di is van herten so onstelt         < 02.655 Die is van herten soe onstelt [597]
01.677 es van herten sere ontstelt         < 01.677 Es van herten sere ontstelt [617]

Figure 195. Appendix C, *Lanseloet* verses 02.0655 (see also fig. 143): the presence of the four character word ‘sere’ in texts 01-09- is ungenealogical.

We, rather arbitrarely, defined a small word as a word with three or fewer characters/phonemes. The ‘over’ example in fig. 188 and the ‘sere’ example in fig. 195 seem to show that a small word consists of four or fewer characters. Then, ‘over’ and ‘sere’ must be considered as added (or deleted) small words as well, which means that they cannot be text-genealogical informants. We must incorporate this new information - that a small word can also contain four characters/phonemes - into characteristic 11a explicitly. Furthermore, we will add to the characteristic that ungenealogical short words cannot belong to the word categories nouns or verbs:

Characteristic 11a:

> The *addition* (or *interpolation*) and *omission* of *words* is genealogically informative when these words fit well or offer no crucial information; short words, containing four or fewer phonemes and belonging to other word categories than nouns and verbs, cannot be used for text-genealogical purposes.

Admittedly, as we discussed in §3.3.1, the part ‘fit well or offer no crucial information’ is vague. Hopefully, this part of the definition (which also occurs in the definition of characteristic 11b) will become more clear in the future.

5.3.11.2. Evaluation of Characteristic 11b, concerning Added or Missing Verses

We can keep our evaluation of this characteristic short. This characteristic has not been falsified. It has only been confirmed by the end groups in the detected characteristic 11b variation formulas in the *Lanseloet* text versions, presented in §11.2.1.1 and §11.2.2.1 of Appendix D:

Figure 197. Appendix C, *Lanseloet* verses 02.0082: an example of the detection of the addition of verses, here in group 11-12-13-14-.

5.3.12. SUMMARY OF THE EVALUATION OF THE CHARACTERISTICS

In §5.3.1 to §5.3.11, the eleven characteristics have been evaluated. This was sometimes problematic due to a shortage of observations, especially in the case of characteristic 3. Future research with other text corpora will teach us the importance of some characteristics and will give us the opportunity to further test and possibly improve or sharpen the characteristics.

For the time being, we conclude that, aside from three exceptions, our characteristics can be maintained, because they have been confirmed or because they have not been falsified by the *Lanseloet van Denemerken* text versions.

The first (small) exception concerns characteristic 2, as discussed in §5.3.2. We added an Appendix to it:

> **Appendix to characteristic 2:** to enable the detection of more detailed information about the shape of a text-genealogical tree, it is good to: a. search for text-genealogical variants that are part of a *type-1 variation* and deal with characteristics 9b, 10 and 11; b. study the economic, family or other relationships of the printers or copyists of the delivered text versions in order to detect possible (non-textual) relationships between the text versions.

The second (small) exception concerns characteristic 11, as discussed in §5.3.11.1. We incorporated in it that added or omitted words can provide text-genealogical information, if the words are not too small (i.e. with four or fewer phonemes):

> **Characteristic 11a**: The *addition* (or *interpolation*) and *omission* of *words* is genealogically informative when these words fit well or offer no crucial information; short words, containing four or fewer phonemes and belonging to other word categories than nouns and verbs, cannot be used for text-genealogical purposes.

The third important exception is characteristic 8. To our surprise, it turned out that we cannot use differences in word order for the development of the text genealogy of *Lanseloet van Denemerken*. Further research will show whether *word order* is untrustworthy in the case of other text corpora as well. At least, the *Lanseloet* case demonstrates that we must be careful when using differences in word order as text-genealogical variants to build text-genealogies.

We did not find convincing evidence or support that adjectives cannot be used as text-genealogical word categories (along with substantives and verbs). We found confirmation for the parallelistic, ungenealogical character of flexion and gender of words. We also confirmed that word categories like adverbs (especially the short or frequently used adverbs) articles, auxiliaries, conjunctions, prepositions and pronouns can be parallelistic. The same is true for orthographical or diacritical differences, differences in vowels, differences in word boundaries, and the use of nonsense words or clearly incorrect words. We also saw that the use of regionally bound variants, differences of flexion, and affixes can be parallelistic.

As far as the software implementation is concerned, the detection of the (same) variation place (mentioned in characteristic 1) can be improved, although this did not cause real problems when dealing with the *Lanseloet van Denemerken* text versions. Because a parser for the automated syntactic and morphological analysis of the verses does not exist, we decided to build a single-word-oriented computer thesaurus. In this thesaurus (shorthand) words are labelled as belonging to one or more non-substantive and non-verbal word categories. Our thesaurus worked reasonably well, but it is not a perfect alternative for a parser.

5.4. CONCLUSION AND SUMMARY

In chapter 5, we discussed two main themes: the evaluation of our *Lanseloet* stemma and the evaluation of the eleven text-genealogical characteristics. Both evaluations were summarized in previous sections. Therefore, this section 5.4 can be quite short.

In §5.2.5, we offered a summary of the evaluation of the stemma, which was performed by comparing it with previously developed *Lanseloet* trees. We saw that the text-genealogical *Lanseloet* trees of Leendertz, Goossens, and Hüsken & Schaars did not give us reason to think that our tree is incorrect. We also saw that our software detected all the variants mentioned by these scholars.

A summary of the evaluation of the text-genealogical characteristics is given in the previous section, §5.3.12. We saw that most characteristics can be maintained. However, it was necessary to add an Appendix to characteristic 2. We also integrated into characteristic 11a the definition of a short word, namely, a word consisting of four or fewer phonemes (and not belonging to the word categories *nouns* and *verbs*). The most surprising element of the evaluation was, that characteristic 8 on word order had to be rejected in the case of *Lanseloet van Denemerken*.

The evaluation of the text-genealogical characteristics, which have the status of hypotheses, did not *prove* without a doubt that they are correct. Further research is necessary to examine whether the characteristics work well in other situations, with other text corpora. The characteristics in this research are not universal. They are developed for the *Lanseloet van Denemerken* text versions (and other Middle Dutch texts). Undoubtedly, some characteristics will have to be adapted or reconsidered before they can be applied to texts in other languages.

6. FINAL REMARKS

Normally, a dissertation ends with a chapter or section called ‘Conclusion and Summary’. In such a chapter, the previous chapters are summarized and attention is paid to the merits and weak points of the dissertation. I considered this to be superfluous here, because all the previous chapters start with an introductory section and end with a concluding and summarizing section. A summary in Dutch, ‘Samenvatting in het Nederlands’ is present on pp. 313-321. Furthermore, in chapter 1 a general view on the contents of this book is offered. In other words, to get a quick impression of what this dissertation is about, the following sections can be read: chapter 1 (pp. 1-9), §2.1 (pp. 11-12), §2.9 (pp. 59-60), §3.1 (pp. 61-63), §3.5 (pp. 109-112), §4.1 (pp. 113-114), §4.10 (pp. 199-201), §5.1 (pp. 203-204) and §5.4 (p. 295).

The question which gave rise to my research was: ‘Can the production of a stemma, in this case of the fourteen *Lanseloet van Denemerken* text versions, be automated?’.

The answer is affirmative. During the last twenty years many stemmas were produced by the computer - although the detection of the variants was not (completely) computerized as in my research. The problem is that the computer is able to build a chain or stemma from almost any arbitrary set of variants, using, for instance, statistical techniques. Even incorrect techniques can, eventually, lead to the production of *a* stemma.

If the question would have been: ‘Can the production of a *trustworthy* stemma be automated?’, it would have been more difficult to answer. The insertion of the adjective ‘trustworthy’ may seem trivial. It is not. I am convinced that in the last decennia many incorrect stemmas must have been produced, with or without the computer. I recall the many traps: Dearing’s incorrect algorithm for creating new variation formulas (§2.6.3), the incorrect use of the Lachmannian notion *common error* (§2.6.1), the non-observable status of Quentin’s *zéro caractéristique* (§3.2.2), and, most importantly, the use of non-significant variants. Obviously, incorrect stemmas lead to false reconstructions of lost original or archetypus texts. I fear that much text-genealogical research will have to be reconsidered.

Before we consider the automation of the stemma production, we need a good theory or a good set of rules or principles for generating text-genealogical trees. Such a theory is also necessary for statistical, *phenetic* genealogists. They too need to justify their choice of their variants, their *facts*. In other words, a theoretical basis must be present, before we can even think of automating the production of stemmas. Without such a theoretical basis, discussions about, for instance, the problem of contamination, do not make much sense.

In this dissertation, I tried to find and formulate a theoretical basis for the development of text-genealogical trees. Of course, the eleven characteristics are not the one and only theory on building chains and stemmas. The characteristics are just a beginning in the development of a theory and must be tested further in other situations with other text corpora. Hopefully, this will lead to new and better

theoretical insights. One of the aims of my research and this book was to demonstrate that the formulation of subjective text-genealogical ideas or hypotheses can be scientifically acceptable. We have shown that hypotheses, the characteristics, can be formulated in such way that they become *intersubjective* (and, therefore, scientifically acceptable) and that (inter)subjective ideas can be performed, tested, checked and evaluated with the help of the computer.

Now, let us reconsider the question: 'Can the production of a *trustworthy* stemma be automated?'. The *Lanseloet van Denemerken* case taught that this is possible, although we still need a good parser to analyze the *Lanseloet* verses automatically. But even if such a parser existed, philologists would still have to judge the variant material. Once the theoretical concepts have grown and these judgements have been incorporated into them, the philologists may become less important. I hope that this book has shown that the computer can play an important role in the development of new theoretical insights. The new role of philologists will be to develop text-genealogical theories or ideas, which the computer will perform.

Let us reconsider, at the end of this final chapter, the text-genealogical characteristics again. Suppose that someone would like to develop the chain of some other medieval Dutch text versions. Then I would advice him to use and test the eleven characteristics (plus the subcharacteristics) for that goal. If this person asked me to give him a shorter list of instructions, I would give him - under protest - the following list with advices and steps to be followed. In this list, the characteristics are implemented *in grosso modo* - not all the details are mentioned. The steps must be followed chronologically, top-to-bottom. This straight top-to-bottom order of the steps can be changed if certain conditions are fulfilled.

1. Find competitive textual differences or variants in equivalent positions in the text versions.
   a. Generally the variants must be single words. (See: *characteristic 1*.)
   b. If the difference does not concern an addition or deletion of one or more complete words, continue with step 1c. If the difference does concern an addition or deletion of one or more complete words and if this addition or deletion shows up in two or more texts, take the following advices into consideration (see: *characteristic 11*):
      - If the addition or omission does not consist of a small and/or common (predictable!) word(s), and is in a type-2 environment (i.e. the variants must be two clearly different competitive words - spelling differences are unimportant - and each variant must occur in at least two text versions), continue with step 6. Otherwise, go (again) to step 1.
        Notice that the word class of the interpolated or vanished word is not important. Small words are considered to contain four or fewer

characters, like ‘al’ ‘also’, ‘dan’, ‘die’, ‘dan’, ‘dat’, ‘en’, ‘ende’, ‘ne’, ‘niet’, ‘no’, ‘noch’, ‘nu’, ‘oec’, ‘so’, ‘want’, etc.

- If the addition or omission concerns complete verses, this variance is often important. The vague criterion here is that the verses concerned cannot be (re)produced easily. If they cannot be (re)produced easily, continue with step 6. In the case of missing/added text in prose text versions - which case has not been studied in this dissertation - continue with step 6.

c. If the difference consists of a difference in word order (see: *characteristic 8*) I warn that this variance may not provide trustworthy information; therefore, begin again with step 1 (and check later on whether the word order variants are in agreement with the developed tree).

d. If the difference concerns an inversion of verses - a condition which cannot be fulfilled in the case of prose texts - (see: *characteristic 10*), continue with step 6.

e. If all the variants in the text versions have been studied, continue with step 7.

2. The variants must be in *type-2 position*: the variants must be two clearly different competitive words (spelling differences are unimportant) and each variant must occur in at least two text versions. (See: *characteristic 2*.) If there are three or more variants, do not use them, but continue with step 1. The type-1 situation will not be discussed here.
3. The variants must be in a grammatically and syntactically adequate environment. (See: *characteristic 3*.) If this condition fails, go back to step 1. Furthermore, if the variants are in verses that do not rhyme well (or that do not have assonant rhyme), this is a sign that the environment of the variants is not adequate. (See: *characteristic 9*). Then, continue with step 1. This characteristic 9 condition can only be applied if the text versions are not in prose. If they are in prose, only the characteristic 3 condition works.
4. Determine the word classes of the variants.
   a. Apart from one exceptional situation (mentionded at step 4b), both variants must be substantive nouns or main verbs or, possibly, adjectives. In other words, except for the situation mentioned at step 4b, variants cannot be adverbs, articles, auxiliaries, conjunctions, prepositions, pronouns, etc. (See: *characteristic 4b*.)
   b. The exceptional situation is that the variants are in rhyming position in verses. Then, the word class of the variants does not matter. (See: *characteristic 5*.) Of course, this exceptional situation cannot occur if the text versions are in prose.
   c. If the word classes are not substantives, main verbs or adjectives, and the exceptional situation does not occur, go to step 1.

   d. If one or both variants are numbers, or if both variants are variances of the same (family) names, or if one variant is clearly an incorrect name, return to step 1.
   e. If the variants concern common, frequently used, very predictable substantives, adjectives or verbs (beware: a precise definition is not available yet!), and it is imaginable that they can be filled in or interchanged by copyists easily, it is likely that these variants are parallelistic. (See: characteristic 7c and 7d.) Then, go to step 1. Examples of such variant couples are: ‘vaen’-‘vangen’ (two verbs expressing ‘catch’); ‘leit’-‘leghet’ (two forms of the verb ‘lay’); ‘segghen’-‘spreecken’ (two verbs ‘speak’ and ‘say’); ‘mogen’-‘connen’ (two verbs ‘may’ and ‘can’); ‘seghet’-‘seit’ (two forms of ‘say’); ‘slapen’-‘in slaap vallen’ (‘sleep’ and ‘fall into sleep’); etc.
5. Study the difference between the two variants (see: *characteristics 6 and 7*). Go to step 1, if the difference between the variants:
   a. is orthographical (which often can be determined with the help of dictionaries) or diacritical (a comma, a paragraph sign, etc.);
   b. or consists of a ‘trivial’ difference in vowels; if the difference consists of a difference in vowels, but both variants concern two clearly different words, the difference is not trivial;
   c. or consists of a difference in flexion, gender, number (singular or plural), tense or affix(es);
   d. or consists of a difference in word boundaries.

   Furthermore, go to step 1 if (both variants or) one variant:
   e. is not a good, normal word, that is: it cannot be a slip of the pen, a nonsense word or a clearly incorrect word or something illogical;
   f. or is regionally or ideolectically bound.
6. Add the (type-2) variation formula to a ‘list of formulas’, as explained in §2.4.2. Go back to step 1.
7. Build a chain from the ‘list of formulas’ (see step 6), with the help of the algorithm in §2.4.4 or with a software package like PAUP (see §2.5.5). Stop all the activities now. (At this point, I will not discuss the process of orienting a chain into a stemma.)

SAMENVATTING IN HET NEDERLANDS

Hoofdstuk 1: Inleiding

In de Middeleeuwen werden teksten met de hand overgeschreven. Kopiisten - en later ook boekdrukkers - introduceerden bewust of onbewust allerlei veranderingen in hun kopieën. Die kopieën met kopieerfouten werden op hun beurt weer overgeschreven, waarbij weer nieuwe veranderingen in de tekst werden aangebracht. Etc. In de loop der tijd gingen veel van de kopieën plus de oorspronkelijke tekst verloren. Ons resteren doorgaans slechts enkele versies van oude teksten; die versies verschillen onderling vaak sterk. *Tekstkritiek* heeft tot doel verloren gegane originele teksten te reconstrueren, waarbij vaak gebruik wordt gemaakt van een *stemma*. Een stemma is een genealogie of stamboom, die de onderlinge verwantschap van de beschikbare tekstversies uitdrukt. In deze dissertatie stellen we, als voorbeeld, het stemma samen van het Middeleeuwse toneelstuk *Lanseloet van Denemerken*; van dit 'abele' spel zijn veertien verschillende versies overgeleverd.

Hoofdstuk 2: Enkele veelgebruikte genealogische methoden

Hoofdstuk 2 behandelt enkele bekende genealogische methoden. Dat zijn methoden of werkwijzen om stambomen mee te bouwen. Achtereenvolgens bespreken we de negentiende-eeuwse methode van Lachmann en de twintigste-eeuwse methoden van Greg en Dearing. Daarna maken we een uitstap naar de biologie om te leren van de biologische inzichten over het ordenen van soorten.

In §2.2 bespreken we hoe we een stemma moeten interpreteren. We zien dat een stemma meestal een abstract beeld geeft van de verwantschapsverhoudingen van overgeleverde tekstversies. Doorgaans zijn (veel) tekstversies verloren gegaan die niet kunnen worden afgebeeld in een stemma. Een stemma kan dan niet anders dan een incompleet of abstract historisch beeld van de genealogische werkelijkheid geven.

Een van de oudste methoden om een stemma samen te stellen, is de negentiende-eeuwse *Methode van Lachmann*, ook bekend onder de naam *Methode van de Gemeenschappelijke Fout*. Die methode is het hoofdonderwerp van §2.3. Een 'fout' is een onorigineel (tekstueel) onderdeel van een tekstversie, die ooit door een of andere kopiist in een kopie werd geïntroduceerd. Als zo'n fout in twee of meer teksten voorkomt, weten we dat die moeten afstammen van een en dezelfde tekst waarin die fout voor het eerst voorkwam. Anders gezegd: een gemeenschappelijke fout - een tekstverschil (of: *variant*) die niet in de originele tekst voorkwam - duidt op een gemeenschappelijke voorouder. Als we voldoende gemeenschappelijke fouten in de tekstversies opsporen, kennen we daarmee de gemeenschappelijke voorouders van de tekstversies. En daarmee kunnen we het relatiepatroon van de tekstversies samenstellen in de vorm van een stamboom of stemma. In deze dissertatie staat stemmaconstructie centraal; het gebruik van stemma's bij tekstconstructie bespreken we nauwelijks.

De Methode van Lachmann gebruikt de gemeenschappelijke fout als stamboombouwsteen. Jammer genoeg biedt deze negentiende-eeuwse methode geen concrete regels waarmee we die fouten kunnen herkennen. Daarom groeide, zeker in de afgelopen decennia, de wetenschappelijke kritiek op de Methode van Lachmann. Terecht stelden en stellen de critici dat het Lachmanniaanse oordeel of een variant 'fout' of 'onoorspronkelijk' is een subjectief, niet-herhaalbaar en oncontroleerbaar karakter heeft. Zo beschouwd is de Methode van Lachmann *onwetenschappelijk*.

Moderne tekstgenealogen als Greg, Quentin, Zarri, Froger, Dees en Dearing bieden alternatieven voor de niet-wetenschappelijke Lachmanniaanse beoordelingen van varianten. We bespreken hun twintigste-eeuwse tekstgenealogische methoden in §2.4. Zij stellen dat we een stemma niet in één keer moeten samenstellen, maar in *twee stappen*. Tijdens de eerste stap creëren we de *chain* of

ketening, die we beschouwen als een soort dieptestructuur of onderliggende structuur van een stemma. Bij het opstellen van een ketening gebruiken we varianten. Alleen hoeven we die niet op hun oorspronkelijkheid of originaliteit te beoordelen, zoals bij de Methode van Lachmann. Pas bij de tweede stap, als we de ketening veranderen (of: *oriënteren*) in een stemma is het noodzakelijk om uitspraken te doen over de originaliteit van enkele varianten. Met de kennis van de oorspronkelijkheid van enkele varianten zoeken we dan naar een punt op de ketening waar alleen maar originele varianten voorkomen. Aan dit oriëntatiepunt trekken we de ketening omhoog, waardoor het een stemma wordt. Doorgaans is het erg lastig en delicaat om dergelijke oordelen over oorspronkelijkheid van varianten te vellen. Dat zal verderop in deze dissertatie (in §4.8) ook blijken, als we van de ketening van *Lanseloet van Denemerken* een stemma willen maken met hulp van enkele op originaliteit beoordeelde varianten. De afgelopen twee decennia hebben filologen in het algemeen geaccepteerd dat het de wetenschappelijke voorkeur heeft om een stemma in de twee genoemde stappen samen te stellen, voornamelijk dus op basis van onbeoordeelde varianten.

Er bestaan verschillende methoden om een ketening te bouwen. Zo is er een methode - die ik propageer en in een *algoritme* (in §2.4.4) beschrijf - die in principe alleen met een speciaal soort tekstverschillen werkt om keteningen te maken: de zgn. *type-2-variaties*. Er zijn vijf verschillende soorten van variantformules of variaties. Bij een daarvan, de type-2-variatie, bevatten alle tekstversies precies twee met elkaar concurrerende varianten, die elk in twee of meer tekstversies voorkomen. Anders gezegd: in een type-2-variatie zijn er precies twee groepen tekstversies die ieder een variant hebben. Alleen deze groepen zijn zgn. *eindgroepen*, de hoofdbouwstenen van keteningen. Uiteraard is de keuze om te werken met type-2-variaties een beperking. Er zullen immers veel varianten zijn die geen type-2-varianten zijn. We zullen echter zien dat deze beperking, de zgn. *type-2-beperking*, helaas noodzakelijk en onontkoombaar is. Mogelijk zal nader onderzoek in de toekomst uitwijzen dat we ook uit een speciaal type variatie met drie groepen tekstversies eveneens informatie over de vorm van ketening kunnen destilleren (zie §2.6.1.2).

In §2.5 bekijken we kort hoe biologen hun plant- en diersoorten op verwantschap ordenen. We ontmoeten daar o.a. de *fenetiek*, die met inductieve statistische methoden genealogieën samenstelt. Ook maken we kennis met de cladistische ordeningsmethode of *cladistiek*. (De tekstgenealogische gedachten die ik in deze dissertatie verwoord, zijn sterk door de cladistiek beïnvloed.) Een van de hoofdgedachten van de cladistiek is dat we niet te vlug een ‘objectief feit’ mogen gebruiken om verwantschapsbomen mee te bouwen. Het feit bijvoorbeeld dat zowel vogels als vliegen vleugels hebben, betekent nog niet dat beide soorten een gemeenschappelijke voorouder met vleugels hebben. De ontwikkeling van de vleugels bij vogels is namelijk totaal anders verlopen dan die bij insecten. Het objectieve feit ‘dat een soort vleugels heeft’ mag dus niet zomaar gebruikt worden voor het samenstellen van verwantschapsbomen van vogels en insecten, zo waarschuwt de cladistiek. Voor cladisten is het niet voldoende dat iets een ‘objectief feit’ is: dat feit moet wel gerelateerd zijn aan het doel waartoe ze worden aangewend. Cladisten verwijten (statistische) fenetici vaak niet zozeer dat zij statistische methoden gebruiken, maar dat zij zeer onzorgvuldig hun feitenmateriaal verzamelen. In de cladistiek erkent men het belang van type-2-variaties en eindgroepen, waarmee direct keteningen (‘phylogrammen’) kunnen worden samengesteld, waarvan later stambomen (‘cladogrammen’) worden gemaakt. Er is de afgelopen decennia de nodige cladistische programmatuur ontwikkeld waarmee biologen/cladisten stambomen bouwen. In §2.5.5 maken we kennis met zo’n cladistisch programma, PAUP.

In §2.6 bekijken we hoe we de cladistische inzichten op het bouwen van stambomen kunnen aanwenden binnen tekstgenealogie. Van de cladisten leren we dat we uiterst voorzichtig moeten zijn om een variant te verheffen tot een objectief feit waarmee we een verwantschapsboom gaan creëren. Wanneer we varianten willen gebruiken om historische verwantschapsbomen te bouwen, moeten die tekstverschillen (historisch) verwantschapsonthullend zijn. Dergelijke varianten noemen we *tekstgenealogisch*. Voorts sterkt de cladistiek ons in de gedachte dat we een stemma in twee

stappen moeten bouwen: eerst de ketening, daarna het stemma. Voorts propageert de cladistiek keteningen te bouwen met eindgroepen uit type-2-variaties, waarmee de cladistiek dus het belang van de type-2-beperking erkent of onderschrijft.

Aan het eind van hoofdstuk 2 bekijken we kort enkele kwesties. In §2.6.1 zien we dat de Lachmanniaanse gemeenschappelijke fout alleen correct kan worden gebruikt als stamboombouwsteen als die fout onderdeel uitmaakt van een type-2-variatie. In §2.6.3 gaan we in op de visie van de filoloog/genealoog Dearing op de type-2-beperking. Hij erkent de correctheid daarvan, maar in de zeventiger jaren ontwikkelde hij een soort *opteltechniek* waarmee uit niet-type-2-variaties nieuwe, kunstmatige, type-2-variaties kunnen worden afgeleid. Daardoor zou de type-2-beperking belangrijk worden afgezwakt. Jammer genoeg falsifiëren we in §2.6.3 die opteltechniek, omdat die tot incorrecte type-2-variaties kan leiden. In §2.7 bespreken we dat het werken met type-2-variaties vereist dat er minimaal vier verschillende tekstversies beschikbaar zijn. Tot slot zien we in §2.8 dat tegenspraak of ruis in varianten (die op verschillende stambomen zou wijzen) nog niet automatisch heeft te betekenen dat er *contaminatie* of tekstbastaardie is opgetreden tijdens de overlevering van tekstversies. Het advies is om eerst te bekijken of de gehanteerde varianten wel correct, d.w.z. verwantschapsonthullend, zijn, alvorens zo'n conclusie te trekken.

Hoofdstuk 3: Op naar een nieuwe tekstgenealogische methode

De hoofdvraag in deze dissertatie is hoe we verwantschapsonthullende tekstverschillen waarmee we verwantschapsbomen kunnen bouwen, *tekstgenealogische varianten*, kunnen herkennen. Uiteraard willen we daarbij niet als Lachmannianen kunnen worden beschuldigd van oncontroleerbaar en niet-herhaalbaar - en daarmee: onwetenschappelijk - gedrag.

Om die hoofdvraag te kunnen beantwoorden is gekozen voor een *geautomatiseerde deductieve (Popperiaanse) aanpak* in vijf stappen. Deze vijf stappen zijn:

1. het formuleren van een *theoretisch framework/kader*;
2. de *formalisatie* daarvan in twintig karakteristieken van tekstgenealogische varianten;
3. de *implementatie* van de twintig karakteristieken in computerprogrammatuur, zodat de computer de twintig karakteristieken kan herkennen/uitvoeren;
4. de *applicatie* van de computerprogrammatuur, uiteindelijk resulterend in een ketening van *Lanseloet van Denemerken*;
5. de evaluatie van de stamboom en de twintig karakteristieken die eraan ten grondslag liggen.

Stap 1 t/m 3 worden in hoofdstuk 3 beschreven, stap 4 in hoofdstuk 4 en stap 5 in hoofdstuk 5.

§3.2 schetst het *theoretisch kader*. Dat bestaat uit zeven basisprincipes die ik hanteer bij tekstgenealogisch onderzoek. Let wel: de basisprincipes zijn nog niet de concrete regels/karakteristieken waarmee we het verwantschapsonthullend karakter van varianten kunnen beoordelen. Ze schetsen slechts hoe ik tegen tekstgenealogisch onderzoek aankijk en vormen de voedingsbodem van die karakteristieken.

De zeven basisprincipes, die dus samen het theoretisch kader uitmaken, zijn:

1. een tekstgenealogische variant moet *stabiel* zijn en niet gemakkelijk in een andere variant kunnen veranderen;
2. een tekstgenealogische variant moet *verifieerbaar/controleerbaar* zijn;
3. een tekstgenealogische variant moet een *zo klein mogelijke variatieplaats* (bij voorkeur niet meer dan één woord) beslaan;
4. een tekstgenealogische variant moet deel uitmaken van een *type-2-variatie*;
5. een tekstgenealogische variant die *een verschil in woordvolgorde betreft* moet bij voorkeur betrekking hebben op drie of meer (betekenisvolle) woorden (die geen bijwoorden mogen zijn);

6. een tekstgenealogische variant is een *zelfstandig naamwoord of een (hoofd)werkwoord*; als de variant in rijmpositie staat mag hij ook tot een andere woordsoort behoren;
7. een tekstgenealogische variant moet in overeenstemming zijn met *filologische en/of historische inzichten*.

In §3.3 zien we wat de tweede stap van de geautomatiseerde deductieve aanpak behelst: het *formalisatieproces*, waarbij concrete karakteristieken of kenmerken van tekstgenealogische varianten worden gegeven. Deze *karakteristieken* zijn min of meer afgeleid van de zeven tekstgenealogische basisprincipes en hebben de status van (subjectieve) *hypothesen*. We kunnen ze *niet bewijzen*, alleen maar verifiëren, falsifiëren of aanscherpen. Tekstgenealogische varianten voor het bouwen van keteningen - en in tweede instantie stemma's - vinden we met behulp van de karakteristieken. Daarom hebben ook de keteningen een hypothetisch karakter.

De elf (hoofd)karakteristieken van tekstgenealogische varianten zijn:

· Karakteristiek 1: tekstgenealogische varianten staan op dezelfde variatieplaats.
· Karakteristiek 2: tekstgenealogische varianten maken deel uit van type-2-variaties.
· Karakteristiek 3: tekstgenealogische varianten staan in grammaticaal correcte (tekst)omgevingen.
· Karakteristiek 4 (4a & 4b): tekstgenealogische varianten behoren tot dezelfde woordsoorten en zijn zelfstandige naamwoorden of (hoofd)werkwoorden.
  4a. Tekstgenealogische varianten behoren tot dezelfde woordsoorten.
  4b. Het zijn zelfstandige naamwoorden of (hoofd)werkwoorden, en bijvoorbeeld niet hulpwerkwoorden (als 'hebben', 'zijn', 'zullen', 'willen', etc.).
· Karakteristiek 5: tekstgenealogische varianten kunnen ook tot een andere woordsoort horen, mits ze in rijmpositie (aan het einde van een vers) staan.
· Karakteristiek 6 (6a, 6b, 6c): tekstgenealogische varianten betreffen geen 'accidentals' (toevallige tekstverschillen) of kleine spellingverschillen. Tekstgenealogische varianten betreffen dus geen:
  6a. Spellingsverschillen of verschillen in diakritische tekens.
  6b. Verschillen in woordgrenzen (soms worden woorden aan elkaar geschreven, dan weer niet).
  6c. Nonsenswoorden of overduidelijke schrijf- of drukfouten die gemakkelijk kunnen worden verbeterd.
· Karakteristiek 7 (7a, 7b, 7c, 7d): tekstgenealogische varianten zijn geen (potentiële) regionale, ideolectische, diachrone of anderssoortige parallellismen. Zo geldt:
  7a. De verschillen tussen genealogische varianten mogen geen verschillen in verbuiging/vervoeging betreffen.
  7b. De verschillen mogen niet bestaan uit (fonetisch) verschillen bestaande uit een of meer klinkers.
  7c. De verschillen mogen niet worden veroorzaakt door verschillen in talen of dialecten.
  7d. Tekstgenealogische varianten horen 'zeldzaam' te zijn, in die zin dat ze niet gemakkelijk kunnen worden veranderd in een andere variant; met deze regel wordt beoogd het gebruik van 'synoniem parellellisme' (zoals namen van bekende personen) te voorkomen.
· Karakteristiek 8, betreffende tekstgenealogische variaties in woordvolgorde:
  Een verschil in woordvolgorde is verwantschapsonthullend/genealogisch, mits dat verschil niet een verschillende plaatsing betreft van een bijwoord in een vers of zin.
· Karakteristiek 9, betreffende het gegeven dat verzen moeten voldoen aan rijmconventies:
  9a. Als tekstgenealogische varianten onderdeel uitmaken van rijmteksten en die varianten in rijmpositie staan, moeten ze voldoen aan rijmconventies. Overtreding van die conventies (als de verzen niet rijmen) kan wijzen op de toevoeging of verdwijning van verzen, wat weer van genealogisch belang kan zijn.

9b. Een speciaal geval van het schenden van rijmconventies treedt op als in een rijmtekst in twee verzen twee keer hetzelfde rijmwoord wordt gebruikt.

- Karakteristiek 10, betreffende de omkering van verzen:
  De omkering van verzen is genealogisch informatief, mits die verzen goed en onopvallend in de tekst passen (zodat er geen aanleiding is voor een kopiist een omkering ongedaan te maken).
- Karakteristiek 11 (11a & 11b), betreffende de toevoeging en weglating van woorden en verzen:
  11a. De toevoeging (of: interpolatie) of weglating van woorden is genealogisch informatief, mits de verzen waarin ze staan of stonden goed lopen (zodat er geen aanleiding is voor een kopiist de toevoeging/weglating ongedaan te maken). Toevoegingen of weglatingen van kleine, hoogfrequente woorden (zoals 'so'), mogen echter niet als genealogische varianten worden gebruikt.
  11b. De toevoeging (of: interpolatie) of weglating van verzen is genealogisch informatief, mits de verzen goed in de tekst ('het verhaal') passen en geen verhaalwezenlijke informatie bevatten.

Merk op dat we sommige karakteristieken alleen kunnen toepassen op rijmteksten als *Lanseloet van Denemerken*. Bij prozateksten zijn die specifieke karakteristieken simpelweg niet van toepassing; de andere resterende karakteristieken natuurlijk wel. Merk ook op dat een aantal karakteristieken vraagt om een kwaliteitsoordeel van de filoloog: de grammaticaliteit (karakteristiek 3), de mate van veranderbaarheid of stabiliteit van een variant (karakteristiek 7d) en de mate waarin een variant past in zijn omgeving (karakteristieken 10, 11a en 11b). Het streven is uiteraard om in de toekomst de karakteristieken aan te scherpen en waar mogelijk uit te breiden. In dat licht moeten we de huidige karakteristieken ook bezien. Zelf beschouw ik ze nog niet als een kant-en-klare en complete tekstgenealogische theorie of methode. Ze zijn meer een aanzet daartoe (en gericht op 'Nederlandstalige' teksten als *Lanseloet van Denemerken* uit ongeveer 1400 tot 1700.)

§3.4 bespreekt de derde stap van de geautomatiseerde deductieve aanpak: de *implementatie*, waarbij de subjectieve karakteristieken worden omgebouwd tot computersoftware. Veel wetenschappers schijnen te denken dat het bedrijven van wetenschap per definitie een objectieve bezigheid is. Ze doen er vaak alles aan om subjectiviteit buiten hun onderzoek te houden. Er zijn er zelfs die menen dat het deductief werken met subjectieve hypothesen per definitie onwetenschappelijk is; vaak verkiezen zij puur descriptief te werken of met objectieve statistische tools te werken. (Overigens bevatten veel statistische methoden, zoals clusteranalyse, nogal wat subjectieve elementen of momenten.) Centraal in de wetenschap staan echter niet 'subjectiviteit' en 'objectiviteit', maar 'controleerbaarheid', 'toetbaarheid' en 'herhaalbaarheid'. Er is wetenschappelijk niks mis met een subjectieve gedachte als een hypothese zolang die gedachte maar door iedereen te volgen of uit te voeren is.

Door de karakteristieken van tekstgenealogische varianten via software (in ons geval in de computertaal Spitbol/SNOBOL) te leren aan de computer, kan dat apparaat een tekstgenealogisch oordeel uitspreken over varianten conform die karakteristieken. Ook kunnen we de computer vragen ons steeds te melden op grond van welke karakteristieken hij een bepaalde variant accepteert of verwerpt als tekstgenealogische variant. De subjectieve karakteristieken in de computer zijn herhaalbaar, toetsbaar en controleerbaar, en daarmee wetenschappelijk acceptabel. Stel dat we de subjectieve karakteristieken beschouwen als (een aanzet tot een) tekstgenealogische theorie of methode. Dan kunnen we stellen dat de computer na de implementatiefase via de software die (subjectieve) theorie of methode op wetenschappelijk verantwoorde wijze kan uitvoeren of toepassen. Uiteraard heeft het werken met de computer nog andere voordelen. Het apparaat is bliksemsnel en zeer consequent in het beoordelen van varianten; hij ziet geen variant over het hoofd gezien. Voorts kunnen we de geautomatiseerde karakteristieken met behulp van de computer vrij eenvoudig evalueren.

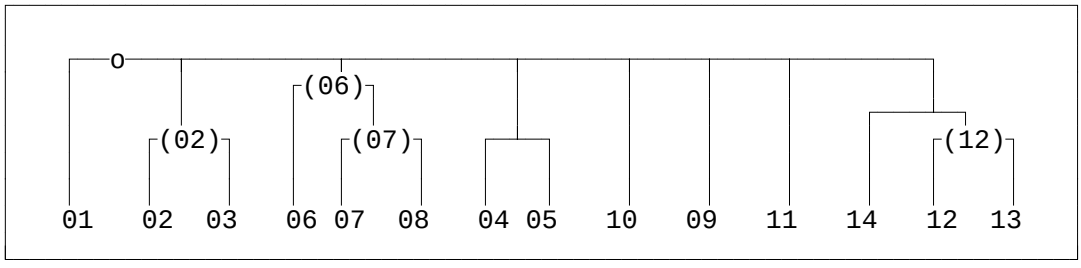
Hoofdstuk 4: Toepassing of applicatie van de karakteristieken/software op de veertien *Lanseloet van Denemerken* tekstversies

Doel van tekstgenealogische methoden is om concrete verwantschapsbomen van tekstversies te produceren. Doel van dit promotie-onderzoek is met hulp van de computer een betrouwbare verwantschapsboom van de veertien tekstversies van *Lanseloet van Denemerken* samen te stellen. Een eerdere test van de software verliep positief: rond 1990 stelde een rudimentaire versie van de software (waarin opgenomen een kleine Middelfranse woordenlijst) al de ketening samen van een aantal Middelfranse versies van Chrétien de Troyes' *Yvain*. Die ketening stemde overeen met de door autoriteiten geaccepteerde *Yvain*-verwantschapsboom. In hoofdstuk 4 bekijken we tot welke resultaten de applicatie van de software (met een kleine thesaurus van *Lanseloet*-woorden) op het *Lanseloet van Denemerken*-corpus leidt.

Eerst besteden we in §4.2 echter enige bibliografische aandacht aan de veertien tekstversies van *Lanseloet van Denemerken*. In die paragraaf wordt o.a. op het belang gewezen van autopsie, het zelf in ogenschouw nemen van de tekstversies, in diverse Europese bibliotheken.

§4.3 demonstreert aan de hand van enkele *Lanseloet*-verzen hoe de software werkt en hoe we de softwareresultaten moeten interpreteren; in Appendices A en B wordt daar overigens een veel uitgebreidere uitleg van gegeven. §4.4 biedt een overzicht van alle tekstgenealogische *Lanseloet*-varianten waarmee volgens de software - en dus volgens de tekstgenealogische karakteristieken - de *Lanseloet*-ketening kan worden samengesteld. De computerprogrammatuur heeft vele tienduizenden varianten getest. De geautomatiseerde karakteristieken blijken hun filterende werk goed te hebben verricht: er resteren slechts ruim 200 varianten die volgens de software voldoen aan de karakteristieken van tekstgenealogische varianten. In §4.5 beschouwen we die ruim 200 varianten kritisch. Wegens kleine onvolkomenheden in de programmatuur blijkt dat we een groot deel van die varianten alsnog kunnen schrappen. Vervolgens worden in §4.6 een lijst met 45 tekstgenealogische varianten gepresenteerd (in zgn. 'variatie(formule)s'), in §4.7.3 aangevuld met nog eens 9 variaties. Met die 54 variatieformules kan de *Lanseloet*-ketening worden samengesteld.

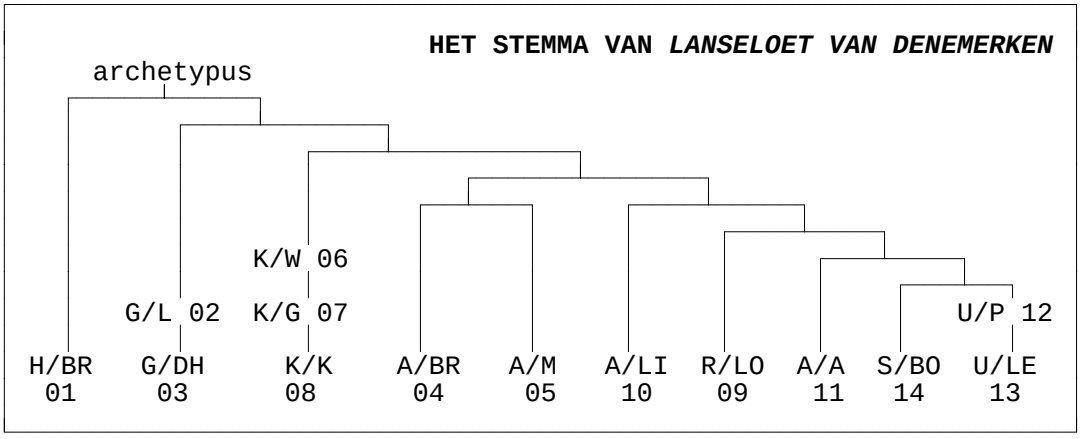
Het bouwen van de ketening kan op twee manieren, zoals in §4.7 wordt getoond: ten eerste, met de hand, met het algoritme uit §2.4.4, en, ten tweede, met de computer, met het programma PAUP, geïntroduceerd in §2.5.5. Uiteraard hadden we enkel voor een van beide manieren kunnen kiezen. Maar als beide manieren tot dezelfde ketening leiden, sterkt dat de betrouwbaarheid van die ketening. Uiteindelijk resultaat van beide aanpakken blijkt één *Lanseloet*-ketening te zijn:



We zien de veertien teksten in de ketening staan. De tekstversies 02, 06, 07 en 12 kunnen mogelijk een alternatieve plek in de ketening innemen: niet als eindknoop aan het einde van een lijnstuk, maar als intermediaire (tussen)knoop op een lijnstuk. (Over de 'o' op de verbindingslijn tussen teksten 01 en 02 komen we aanstonds te spreken.)

In §4.7.2 en §4.7.4.3 gaan we in op de betrouwbaarheid van de *Lanseloet*-ketening. Gegeven de 54 variantieformules is de ketening optimaal. Alle gebruikte varianten zijn namelijk in overeenstemming met de afgebeelde ketening. Daarmee is natuurlijk niet *bewezen* dat de ketening correct is. Ik herhaal dat de karakteristieken waarmee we de 54 formules hebben gevonden hypothesen zijn. Hypothesen kunnen we niet bewijzen; we kunnen ze alleen maar verifiëren, falsifiëren of aanscherpen. De ketening die uit de 54, met hypothesen gebouwde, formules is gedestilleerd is eveneens een hypothese. Er is echter geen enkele goede reden, in de vorm van één of meer tekstgenealogische varianten, om aan te nemen dat de ketening incorrect zou zijn.

Bij het samenstellen van de afgebeelde *Lanseloet*-ketening hebben we de gehanteerde tekstgenealogische varianten niet beoordeeld op hun originaliteit. Om van de ketening een stemma te maken, onderwerp van §4.8, moeten we wel uitspraken doen over de originaliteit van enkele varianten. Dat blijkt geen eenvoudige zaak te zijn. Ook daarom proberen we via twee van elkaar onafhankelijke wegen het punt op de ketening te vinden waar alleen maar oorspronkelijke varianten voorkomen. Als beide speurtochten leiden tot hetzelfde originaliteitspunt - en dat blijkt het geval te zijn - is het aannemelijker dat het gevonden punt correct is. Het originaliteitspunt in de afgebeelde ketening is het al ingetekende punt ‘o’ tussen teksten 01 en 02. Als we de ketening daaraan omhoog trekken, levert dat het volgende stemma van *Lanseloet van Denemerken* op:



Merk op dat in het stemma de sigla van de *Lanseloet van Denemerken*-teksten zijn opgenomen, zoals uitgelegd in §4.2. Zo is ‘H/BR’ (handschrift Van *H*ulthem, thans aanwezig in de Koninklijke Bibliotheek in *BR*ussel) het siglum van tekst 01, en ‘K/K’ dat van tekstversie ‘08’.

Toegegeven, het oriënteren van de ketening van *Lanseloet van Denemerken* blijkt niet eenvoudig te zijn. Ik wil hier benadrukken dat we voor het evalueren van de theoretische karakteristieken in hoofdstuk 5 in principe voldoende hebben aan de *Lanseloet*-ketening; het stemma hebben we daar niet voor nodig. Dus al zou de ketening fout zijn georiënteerd tot een incorrect stemma, dan heeft dat toch geen consequenties voor de evaluatie van de tekstgenealogische karakteristieken. Anders verwoord: als het stemma incorrect is, als gevolg van het incorrect oriënteren van de ketening, dan heeft dat voor de theorie geen enkele consequentie.

Hoofdstuk 5: Evaluatie van het stemma en de karakteristieken

We kunnen niet absoluut bewijzen dat ons stemma van *Lanseloet van Denemerken* correct is. Wat we wel kunnen doen, is die boom vergelijken met eerder opgestelde *Lanseloet*-stemma’s. Dat

gebeurt in §5.2. Nadeel van de *Lanseloet*-stambomen in Leendertz (1907), Goossens (1973), Goossens (1976) en Hüsken & Schaars (1984) is dat ze slechts betrekking hebben op een klein deel van de *Lanseloet*-tekstversies. Voorts vertoont de systematiek waarmee Leendertz en Goossens hun *Lanseloet*-stemma's opstelden serieuze tekortkomingen. Hoe dan ook, onze boom blijkt min of meer overeen te stemmen met de (deel)stemma's uit 1907, 1973, 1976 en 1984. De slotsom van §5.2 is dat we geen reden hebben gevonden in om aan te nemen dat ons *Lanseloet*-stemma fout is. Anders gezegd: zolang het tegendeel niet wordt aangetoond, kunnen we stellen dat onze *Lanseloet*-ketening en ons *Lanseloet*-stemma correct zijn.

In §5.3 evalueren we de tekstgenealogische karakteristieken. Sommige karakteristieken zijn 'negatief', in de zin dat ze stellen dat we een bepaalde variant niet als tekstgenealogische bouwsteen mogen gebruiken. Andere karakteristieken zijn weer 'positief', omdat ze poneren dat een variantsoort juist wel voor het bouwen van een verwantschapsboom kan worden aangewend. Voorbeeld van een negatieve karakteristiek is 7a: "De verschillen tussen genealogische varianten mogen geen verschillen in verbuiging/vervoeging betreffen". Een positieve karakteristiek is 4b: "Tekstgenealogische varianten zijn zelfstandige naamwoorden of (hoofd)werkwoorden, en bijvoorbeeld niet hulpwerkwoorden (als 'hebben', 'zijn', 'zullen', 'willen', etc.)." We weten niet precies hoe we moeten omspringen met karakteristiek 8, die zegt dat verschillen over woordvolgorde tekstgenealogische informatie bieden. We beschikken over indicaties dat deze karakteristiek incorrect zou kunnen zijn. Daarom bestempelen we karakteristiek 8 als 'twijfelachtig'. We gebruiken haar voorlopig niet en kijken pas in de evaluatiefase naar haar tekstgenealogische waarde.

Bij de evaluatie gaan we er, zoals gezegd, van uit dat onze *Lanseloet*-ketening correct is. We evalueren een karakteristiek door te kijken of (een deel van de) ketening fout zou kunnen worden getekend als die karakteristiek niet zou hebben bestaan. In geval van de evaluatie van, bijvoorbeeld, karakteristiek 7a gaan we in het variantenmateriaal zoeken naar een verbuigingsvariant die duidt op een familie of groep van verwante teksten die niet in de ketening is terug te vinden. Als zo'n contraherende variant wordt gevonden, kunnen we stellen dat karakteristiek 7a bestaansgrond heeft. Zou die karakteristiek niet zijn geformuleerd, dan zou de variant niet zijn afgekeurd en ons hebben kunnen leiden tot de aanname van incorrecte verwantschapsrelaties.

Uit de evaluatie leren we, ten eerste, dat er een appendix moet worden toegevoegd aan karakteristiek 2, omdat type-1-variaties belangrijk blijken te zijn om detailinformatie van een ketening te kunnen achterhalen (zie §5.3.2):

> **Appendix bij karakteristiek 2**: om meer gedetailleerde informatie over de vorm van een ketening te achterhalen is het aan te raden: a. om te zoeken naar tekstgenealogische varianten die deel uitmaken van een type-1-variatie en die vallen onder karakteristieken 9b, 10 en 11; b. om de economische en andere relaties van boekdrukkers of kopiisten van de tekstversies te bestuderen om mogelijke (niet-textuele) relaties van tekstversies te achterhalen.

Ten tweede toont de evaluatie van karakteristiek 11 (in §5.3.11.1) aan dat we de formulering daarvan moeten uitbreiden. De oude omschrijving vermeldt dat toegevoegde of weggelaten woorden tekstgenealogische informatie kunnen bieden, mits die woorden niet te klein zijn. Daaraan kunnen we door de evaluatie de nadere bepaling toevoegen dat een te klein woord vier of minder fonemen bevat.

Ten derde blijkt uit de evaluatie dat karakteristiek 8 over woordvolgorde incorrect is. We constateren, toch enigszins tot onze verrassing, dat verschillen in woordvolgorde in het geval van *Lanseloet van Denemerken* incorrecte tekstgenealogische informatie kan bieden die in tegenspraak is met de *Lanseloet*-ketening.

Ten vierde kampen we met het probleem dat voor enkele karakteristieken onvoldoende *Lanseloet*-varianten te vinden zijn. Zo konden we door een gebrek aan adjectievenvarianten niet bepalen of we karakteristiek 4b mogen uitbreiden met de informatie dat er niet twee, maar drie tekstgenealogische woordcategorieën zijn: zelfstandige naamwoorden, (hoofd)werkwoorden en adjectieven.

Met uitzondering van de aangeduide gevallen bevestigt de evaluatie in het algemeen de correctheid van de karakteristieken. Toch moeten we voorzichtig met die conclusie omspringen, omdat de evaluatie natuurlijk niet het definitieve bewijs levert dat die hypothesen correct zijn. Nader onderzoek van andere tekstcorpora moet ons helpen in de toekomst de (aangevulde) tekstgenealogische karakteristieken verder aan te scherpen.

Characteristics 1 to 11 (of text-genealogical variants):
1. Characteristic 1, concerning the variation place
- Introduction, definition and example(s): 90, 91
- Evaluation: 225-228
- Further discussion (concerning 'variation place' and/or 'characteristic 1'): 21-25, 32, 48-51, 56, 65, 66, 75, 77-82, 86, 103, 105, 108-111, 121, 123-126, 128, 129, 131, 134, 135, 142, 144, 150, 155-157, 161, 172, 180, 181, 200, 224, 229, 235, 242, 284, 286, 297, 300, 301

2. Characteristic 2, concerning type-2 variations (the type-2 limitation)
- Introduction, definition and example(s): 91, 92
- Evaluation: 229, 230
- Further discussion (concerning 'type-2' and/or 'characteristic 2'): 5-8, 11, 15, 23-34, 38, 42, 44, 47-59, 78-83, 86, 87, 89, 93, 100, 103, 105, 108, 111, 134, 142, 296, 297, 301; *see also* Principle 4; Type-2 limitation

3. Characteristic 3, concerning grammatical adequacy
- Introduction, definition and example(s): 92, 93
- Evaluation: 230, 231
- Further discussion (concerning 'grammatical/syntacical adequacy' and/or 'characteristic 3'): 65, 66, 68, 81, 82, 99, 104, 108, 111, 112, 134, 225, 231, 234, 255, 259, 278, 296, 301

4. Characteristic 4
- Characteristic 4a, concerning word classes: 93
  . Introduction, definition and example(s):

. Evaluation: 231-235
. Further discussion (concerning ‘word class’ and/or ‘characteristic 4a’): 81, 82, 85, 86, 88, 89, 103, 108, 111, 126-131, 134, 209, 224, 230, 264, 265, 300, 301
- Characteristic 4b, concerning substantives and verbs (except auxiliaries)
. Introduction, definition and example(s): 93
. Evaluation: 134, 231-233, 235-266
. Further discussion (concerning ‘characteristic 4b’): 88, 89, 92, 94, 103, 108, 111, 113, 126, 130, 144, 159, 209, 211, 212, 221, 224, 230, 301; for information about the word classes ‘nouns’, ‘substantives’ and ‘verbs’: *see* Word classes; *see also* Principle 6

5. Characteristic 5, concerning variants in rhyming position
- Introduction, definition and example(s): 93, 94
- Evaluation: 266, 267
- Further discussion (concerning ‘variants in rhyming position’ and/or ‘characteristic 5’): 69, 85, 86, 89, 99, 103, 105, 110-112, 127, 130, 131, 134-136, 142, 146, 163, 199, 200, 213, 222, 226, 227, 254, 281, 283, 301; *see also* Characteristic 9a; Principle 6; Rhyme

6. Characteristic 6, concerning (paralellistic) spelling differences
- Characteristic 6a, concerning (paralellistic) orthographical and diacritical variants
. Introduction, definition and example(s): 94
. Evaluation: 267-269
. Further discussion (concerning ‘orthographical variants’, ‘diacritical variants’ and/or ‘characteristic 6a’): 16, 66, 71, 95, 103, 106, 107, 111, 114, 130-134, 143, 180, 209, 213, 236, 267, 272, 282, 296, 302
- Characteristic 6b, concerning (paralellistic) word boundaries (and splitting words into parts)
. Introduction, definition and example(s): 94
. Evaluation: 270, 271
. Further discussion (concerning ‘word boundary’, ‘splitting words’ and/or ‘characteristic 6b’): 67, 77, 103, 111, 131-134, 267, 296, 302
- Characteristic 6c, concerning (paralellistic) nonsense words, slips of the pen, typographical mistakes (mistakes of the typesetter), corrupt words
. Introduction, definition and example(s): 95
. Evaluation: 271, 272
. Further discussion (concerning ‘nonsense words’, ‘slips of the pen’, ‘typographical mistakes’, ‘corrupt words’ and/or ‘characteristic 6c’): 66, 68, 93, 104, 107, 111, 134, 165, 180, 213, 267, 296, 302

7. Characteristic 7, concerning certain types of parallelism
- Characteristic 7a, concerning (paralellistic) inflection
. Introduction, definition and example(s): 96
. Evaluation: 272-274
. Further discussion (concerning ‘inflection’ and/or ‘characteristic 7a’): 70, 89, 95, 96, 103, 108, 112, 130, 134, 143, 209, 213, 269, 302; *see also* Inflection; Parallelism
- Characteristic 7b, concerning (parallelistic) differences of vowels
. Introduction, definition and example(s): 96, 97
. Evaluation: 274, 275
. Further discussion (concerning ‘vowel (differences)’ and/or ‘characteristic 7b’): 103, 106, 108, 112, 123, 127, 132, 134, 143, 155, 213, 230, 277, 282, 296, 302
- Characteristic 7c, concerning (parallelistic) differences between languages or dialects
. Introduction, definition and example(s): 97
. Evaluation: 275, 276
. Further discussion (concerning ‘language’, ‘dialects’ and/or ‘characteristic 7c’): 7, 16, 18, 40, 66-70, 77, 86, 87, 96, 97, 100, 103, 105, 112, 114, 130, 131, 134, 142, 164, 169, 209, 213, 230-232, 244, 246, 247, 249, 251, 264, 271, 273, 276, 279-281, 302

- Characteristic 7d, concerning (a.o.) the highly frequent (parallelistic) variants andnames of persons or things
  . Introduction, definition and example(s): 98
  . Evaluation: 277, 278
  . Further discussion (concerning 'frequency of variants' and/or 'characteristic 7d'): 68, 70, 86, 98, 101-103, 105, 112, 113, 134, 136, 143, 146, 199, 233, 243, 280, 285, 287, 291, 296, 302; *see also* Characteristic 11a; Names

8. Characteristic 8, concerning word order
- Introduction, definition and example(s): 99
- Evaluation: 278-281
- Further discussion (concerning 'word order' and/or 'characteristic 8'): 5, 69, 70, 81-83, 85, 103, 108, 110, 112, 124, 125, 134, 144, 155, 203, 209, 225, 228, 246, 254, 296, 297, 301; *see also* Principle 5; SOV-order

9. Characteristic 9, concerning rhyming conventions
- Characteristic 9a, concerning variants in (assonantic) rhyme
  . Introduction, definition and example(s): 99, 100
  . Evaluation: 281-284
  . Further discussion (concerning 'characteristic 9a'): 85, 103, 107, 112, 134, 156, 301; *see also* Assonance; Characteristic 5; Rhyme
- Characteristic 9b, concerning duplicate rhyming words
  . Introduction, definition and example(s): 100
  . Evaluation: 284-286
  . Further discussion (concerning 'duplicate rhyming words' and/or 'characteristic 9b'): 85, 103, 107, 112, 134, 146-150, 155-158, 183, 229, 230, 281, 296, 301; *see also* Principle 6

10. Characteristic 10, concering inversion of verses:
  . Introduction, definition and example(s): 101
  . Evaluation: 286
  . Further discussion (concerning 'inversion' and/or 'characteristic 10'): 44, 84, 85, 101, 103, 107, 112, 133, 135, 144, 146-150, 155, 156, 166-171, 221, 226, 229, 230, 286, 296, 301

11. Characteristic 11, concerning addition and omission of words and verses
- Characteristic 11a, concerning addition and omission of words
  . Introduction, definition and example(s): 101, 102
  . Evaluation: 287-294
  . Further discussion (concerning 'characteristic 11a'): 104, 112, 128, 129, 135, 207, 209-213, 221, 230, 243, 297, 300; *see also* Characteristic 7d; Omission; Principle 5
- Characteristic 11b, concerning addition and omission of verses
  . Introduction, definition and example(s): 101, 102
  . Evaluation: 294, 295
  . Further discussion (concerning 'characteristic 11b'): 85, 104, 107, 112, 135, 146, 156, 207, 229, 230, 232, 296, 300; *see also* Omission; Principle 5

Sigle(s) of *Lanseloet van Denemerken* text versions: 115-117
- H/BR (01) = Manuscript Van Hulthem, ±1415; Royal Library in Brussels (Belgium): 80, 90, 96, 102, 115-117, 119, 122, 155, 157, 163, 172, 177, 178, 182, 186, 187, 192-195, 198, 199, 204, 205, 209, 210, 213, 218, 222, 226, 238, 240, 265, 266, 276, 290
- G/L (02) = Gouda, Govert van Ghemen, ±1490; Library of Lübeck (Germany) (lost manuscript, available in facsimile): 80, 106, 115, 116, 119, 120, 122, 157, 161, 162, 170, 171 178, 186, 187, 198, 199, 204-206, 209, 210, 212, 213, 266, 272, 290
- G/DH (03) = Gouda/Leiden, Govert van Ghemen, ±1490; Royal Library in The Hague (The Netherlands): 80, 115-117, 120, 158, 161, 162, 170, 171, 178, 186, 210, 265, 266
- A/BR (04) = Antwerp, Adriaen van Berghen, 1508; Royal Library in Brussels (Belgium): 80, 116-120, 162, 208-212, 238, 240, 276
- A/M (05) = Antwerp, Willem Vorsterman, ±1520; Bayerische Staatsbibliothek in Munich (Germany): 116-120, 162, 163, 204-206, 208-213, 216, 218, 238, 240, 276
- K/W (06) = Cologne, Koelhoff d. J. (?), ±1500; Herzog August Bibliothek in Wolfenbüttel (Germany): 116, 117, 120, 164, 170, 171, 178, 206, 209, 210, 216-218, 242, 265
- K/G (07) = Cologne, Heinrich von Neuss (?), 1500-1508; Niedersächsische Staats- und Universitätsbibliothek in Göttingen (Germany): 116, 117, 120, 121, 164, 165,

170, 171, 178, 204-206, 208-210, 212-214, 216-218, 265, 266
- K/K (08) = Cologne, Heinrich von Neuss (?), ±1515; University and City Library in Cologne (Germany): 116, 117, 119-121, 164, 165, 170, 171, 178, 204-206, 208-210, 212, 213, 215-218, 265, 266
- R/LO (09) = Rotterdam, unknown printer, ±1612; British Library in London (England) 116, 117, 119, 121, 166
- A/LI (10) = Antwerp, Godtgaf Verhulst, 1649; University Library in Liège (Belgium): 116, 117, 119, 121, 167, 242, 247
- A/A (11) = Antwerp, Martinus Verhulst, 1666; Library of the Museum Plantin Moretus in Antwerp (Belgium): 116, 117, 119, 121, 167, 204-206, 208
- U/P (12) = Utrecht, Jurriaen van Poolsum, 1684; National Library in Paris (France): 116, 117, 119, 121, 168, 170, 171, 173, 175, 176, 218-222
- U/LE (13) = Utrecht, Wed. van Poolsum, 1708; University Library in Leiden; (The Netherlands): 116, 117, 121, 168, 170, 171, 173, 175, 176, 218-222, 265, 266
- S/BO (14) = Handschrift 's-Gravenpolder, 1684-1720; Library of the Archives of Borsele (The Netherlands): 76, 80, 106, 115-117, 121, 168, 169, 175-178, 209, 210, 218, 222, 224, 247

Signatures (on paper leaves): 119-121
Significant variant: *see* Heavy (weight) variant
Simple variant or simple variation: *see* Variation formula
Singular reading / Unique reading: 17
Single word boundary: *see* Characteristic 6b
Size of variant or variation place: *see* Variation place
Sketching a text-genealogical tree: 151-172
Slips of the pen: *see* Characteristic 6c
Small words: 83, 84, 102, 128, 185, 209-212, 221, 243, 291, 292-294, 300; *see also* Common words; Characteristic 11a
Small differences between variants: *see* Characteristic 6a

LISTS OF FIGURES AND PICTURED LANSELOET VERSES

LIST OF FIGURES, INCLUDING THEIR CAPTIONS

Figure 1. Example of a stemma. . . . 4
Figure 2. A stemma as a historical image and as a tool for text reconstruction. . . . 13
Figure 3. A stemma offers an abstract historical view of the deliverance of text versions. . . . 14
Figure 4. Stemma of arbitrary texts A to F, with four intermediate nodes i1 to i4 and one lost (intermediate) original text O. . . . 20
Figure 5. Now text C is an intermediate node; it took over the position of i4. . . . 20
Figure 6. This stemma is equivalent to the one in fig. 5. . . . 20
Figure 7. Variants of texts A to G at nine variation places. . . . 21
Figure 8. Five assumed Lachmannian judgements on the originality of variants. . . . 21
Figure 9. The stemma of the seven texts A to G. . . . 22
Figure 10. The five types of variation: type-0 to type-4. . . . 25
Figure 11. Examples of variation formulas and the types of variation they belong to. . . . 25
Figure 12. Salemans's algorithm to build chains from type-2 variation formulas. . . . 28
Figure 13. Salemans's algorithm of fig. 12 demonstrated (in figs. 13a to 13h). . . . 29
Figure 14. End groups are connected to a chain by one line of connection. If we cut ('#') such line, the chain splits into two end groups (occurring in simple variations; see fig. 10), as is demonstrated in figs. 14a to 14c. . . . 31
Figure 15. Orienting the chain into a stemma. . . . 32
Figure 16. Another point of orientation on the chain leads to another stemma. . . . 32
Figure 17. The chain for the type-2 variation AB:CD, with eleven potential points of orientation: seven points in the chain plus the four texts. . . . 34
Figure 18. The eleven stemmas, derived from the (single) chain in fig. 17. . . . 35
Figure 19. Matrix with six wine glasses, their features and their feature states. . . . 36
Figure 20. Three transformations of features lead to a network or chain. . . . 37
Figure 21. Four identical chains in different shapes. . . . 37
Figure 22. A 'star' chain for the variation AB:CD:EF. . . . 38
Figure 23. The point of orientation lies in the common part of the original areas of taxons 1,2 and 3,4,5,6. . . . 39
Figure 24. The stemma, found by pulling up the chain at the point of orientation between original variants '0-fo' and 'sq'. . . . 39
Figure 25. *Yvain* formulas and matrix. . . . 44
Figure 26. NEXUS-file derived from the *Yvain* formulas. . . . 45
Figure 27. First *Yvain* chain by PAUP. . . . 45
Figure 28. Second *Yvain* chain by PAUP. . . . 45
Figure 29. Presumed correct stemma of texts A to F. . . . 50
Figure 30. Incorrect stemma of texts A to F, built with the groups of formulas AB:CD:EF and ABCD:EF. . . . 50
Figure 31. One possible stemma for the variation formula AB:CD:EF, together with its chain; AB is not an end group here. . . . 52
Figure 32. Another possible stemma for formula AB:CD:EF, together with its 'star' chain; here, AB is an end group. . . . 52
Figure 33. If we know that three texts share an exclusive and immediate ancestor ('x') several possible stemmas can be drawn. . . . 53

Figure 65. *Lanseloet* variation formulas concerning characteristic 5 (‘words in rhyming position’). 136
Figure 66. *Lanseloet* variation formulas concerning characteristic 7d (‘different names’). 136
Figure 67. Output in Appendix C, *Lanseloet* verses 02.1006: the name ‘Iesum Christum’ only occurs in texts 09-11-12-13-. 136
Figure 68. 239 *Lanseloet* variation formulas, not rejected by any characteristic. 137
Figure 69. The remainder: 21 *Lanseloet* variation formulas. 145
Figure 70. The result (= figs. 61, 62, 63, 64, 65, 66 and 69 combined): 45 *Lanseloet* variation formulas. 146

Figure 71. 45 *Lanseloet* variation formulas, including the original (non-shorthand) variants. 148
Figure 72. Fourteen *Lanseloet* end groups a to n. 152
Figure 73. Application of the algorithm in fig. 12 to build the chain of the *Lanseloet van Denemerken* text versions; only the ten end groups in fig. 72 with seven or less members are used. 153
Figure 74. First handmade sketch of the *Lanseloet van Denemerken* chain. 154
Figure 75. Output in Appendix C, *Lanseloet* verses 02.0827 (with the context of verses 02.0828 included): the software detects duplicate rhyming words in text 02. 157
Figure 76. Output in Appendix C, *Lanseloet* verses 02.0390: the variants ‘ni’ and ‘not’. 159
Figure 77. Output in Appendix C, *Lanseloet* verses 02.0393: texts 02 and 03 have the same verses. 159
Figure 78. Output in Appendix C, *Lanseloet* verses 02.0385: the variant ‘spoet’ occurs in texts 01-02-03-05-06-07-08-10-. 160
Figure 79. Output in Appendix C, *Lanseloet* verses 02.0206: the word ‘gewagen’ is only to be found in text 04. 162
Figure 80. Output in Appendix C, *Lanseloet* verses 02.0987 (with the context of verses 02.0986 and 02.0988 included): the software detects a missing verse in text 08. 165
Figure 81. Output in Appendix C, *Lanseloet* verses 02.0522: text 09, with the inversion of verses, cannot be an intermediate text (in fig. 60 the accompanying verses 02.0523 are presented). 167
Figure 82. Output in Appendix C, *Lanseloet* verses 02.0123. 167
Figure 83. Output in Appendix C, *Lanseloet* verses 02.0777 (with the context of verses 02.0778 included): the software detects an inversion of (the rhyming words of) the verses of text 14. 169
Figure 84. Nine extra *Lanseloet* variation formulas 46 to 54, as an Appendix to formulas 1 to 45 in fig. 71. 170
Figure 85. Second, (with the help of the nine extra formulas) more refined, handmade sketch of the *Lanseloet van Denemerken* chain. 171
Figure 86. Example of the transformation of variation formula 01 into NEXUS shape, using values ‘0’, ‘1’ and ‘?’. 172
Figure 87. Matrix with the 54 *Lanseloet* variation formulas in NEXUS shape. 173
Figure 88. The ‘temporary minimal distance’ between texts 05 and 06 is 12; their ‘actual minimal distance’ is 13 (once the missing values ‘?’ have been substituted by ‘0’ or ‘1’). 174
Figure 89. The chain of the *Lanseloet van Denemerken* texts as developed by PAUP. The numbers on the lines of connection represent the distances or numbers of the different variants. In the upper right corner an alternative part of the chain is drawn, concerning texts 12, 13 and 14. 175
Figure 90. Two different chain parts for texts 12, 13 and 14, pictured in figs. 90a and 90b. Both parts are equal if the text 12 branch collapses, as demonstrated in fig. 90c. 176
Figure 91. The definite chain of *Lanseloet van Denemerken* (presented in the lower box). 177
Figure 92. *Lanseloet* verses 02.0259 to 02.0262: texts 09-10-11-12-13-14- have the same non-rhyming word ‘komen’, which seems to be unoriginal; only in text 01 the first word of the new clause rhymes with the previous clause, which is also noticed by Leendertz (1907:XXII), who says that verse ‘265’ (our 01.0259) is original. 182

Figure 93. *Lanseloet* verses 02.0816 and 02.0817: texts 06-07-08- share the same violation of rhyme, which seems to be unoriginal. (The verses of fragmentary texts 03, 04 and 14 are not delivered; these three texts are not displayed in this figure.) 183
Figure 94. *Lanseloet* verses 02.0739 and 02.0740: texts 04-05- have the same rhyming word twice; this violation of rhyme shows that texts 04-05- possibly contain unoriginal variants. 184
Figure 95. *Lanseloet* verses 02.0526 to 02.0529: texts 05-06-07-08- have non-rhyming verses, which indicates that these texts (probably) contain unoriginal variants. 184
Figure 96. Unoriginal (shaded) areas in the chain of *Lanseloet van Denemerken* so far. 185
Figure 97. *Lanseloet* verses 02.0581 to 02.0584: the element ‘seyt hi’ in texts 05-06-07-08- does not make sense and is, therefore, probably unoriginal. (The verses of the fragmentary texts 03, 04 and 14 are not delivered; these three texts are not displayed in this figure.) 186
Figure 98. Expanded unoriginal (shaded) areas in the chain of *Lanseloet van Denemerken*. 186
Figure 99. *Lanseloet* verses 02.0658 and 02.0659: the element ‘sijn h(er)te en(de) sijn gheclach’ in text 01 is probably unoriginal, which is also claimed by Leendertz (1907:XXV). (The verses of fragmentary texts 03, 04 and 14 are not delivered; these three texts are not displayed in this figure.) 187
Figure 100. *Lanseloet* verses 02.0159 to 02.0161: in text 02 a complete verse is missing, which is probably unoriginal, because the rhyme is broken. (The verses of fragmentary texts 03, 04 and 14 were not delivered; these three texts are not displayed in this figure.) 188
Figure 101. Further expanded unoriginal (shaded) areas in the chain of *Lanseloet van Denemerken*: texts 01 and 02 (and 03) cannot be in the original area. 189
Figure 102. *Lanseloet* verses 02.0486 to 02.0493: we agree with Leendertz (1907:XXIII) that verses 01.0514 and 01.0515 are probably original and that the interpolation of verses like 02.0488 and 02.0490 was necessary because the original ‘geboren sijt’ was changed into ‘sijt geboren’, which violates the rhyme scheme. (The verses of the fragmentary texts 03, 04 and 14 are not delivered and not displayed in this figure.) 189
Figure 103. The distribution of the variants ‘riep’ and ‘riet’ (verse 02.0491). 190
Figure 104. The point of orientation in the chain of *Lanseloet van Denemerken* is detected: it must lie between text 01 and all the other texts. 191
Figure 105. *Lanseloet* verses 02.0070 to 02.0075: ‘original’ criterion b is fulfilled only in text 01; criterion b is that the first verse of a clause rhymes with the last verse of the preceding clause; for that reason Leendertz (1907:XXII) is also convinced that verse ‘94’ (our 01.0108) is more original than the comparable verses in the other texts. 192
Figure 106. *Lanseloet* verses 02.0258 to 02.0263: again only text 01 fulfils criterion b, with the first verse of a clause rhyming with the last verse of the preceding clause; for that reason Leendertz (1907: XXII) is also convinced that verse ‘265’ (our 01.0295) is more original than the comparable verses in the other texts.. 193
Figure 107. *Lanseloet* verses 02.0066 and 02.0067: text 01 mentions ‘blijft getrouwe’ (= stay faithful); the word ‘blijft’ does not make much sense

and seems to be unoriginal, as is confirmed by Leendertz (1907:XXV). 194
Figure 108. *Lanseloet* verses 02.0451 to 02.0454: it is more likely that the Knight thanks God because he got up *early* (‘vroech’) in the morning than that he thanks God because he woke up in the morning. Leendertz (1907:XXV) is convinced that verse ‘433’ (our 01.0478) of text H/BR=01 is unoriginal. (The verses of fragmentary texts 03, 04 and 14 are not delivered; these three texts are not displayed in this figure.) 194
Figure 109. Adapted version of fig. 104: the *Lanseloet* chain, with the point of orientation. 195
Figure 110. The stemma of *Lanseloet van Denemerken*, without collapsed branches. 195
Figure 111. The final, definite stemma of *Lanseloet van Denemerken*. 196
Figure 112. *Lanseloet* verses 02.0077 to 02.0082: it is remarkable the words ‘haven’ and ‘maghen’ do not rhyme optimal, while they occur in all the texts. (The verses of fragmentary texts 03 and 04 are not delivered; both texts are not displayed in this figure.) 197
Figure 113. *Lanseloet* verses 02.0480 and 02.0481: it is likely that ‘daen’ of text 14 should be read as the adverb ‘dan’, which occurs in the closely related texts 11 to 13. 113
Figure 114. Stemma by Leendertz (1907:72); his H is our H/BR=01; G is G/L=02; A is A/M=05; Pl is A/A=11; K is K/G=07; K1 is K/K/=08. 205
Figure 115. Repetition of a part of our stemma; notice that many texts and lines of connection have been removed from our stemma, in order to make the comparison with Leendertz’s stemma easier; the absences are denoted by ‘...’. 205
Figure 116. Selected part of the output in Appendix C, *Lanseloet* verses 02.0833 - 02.0844: in verse 02.0843 the pronoun ‘u’ is missing, which can be reconstructed quite easily. 207
Figure 117. Stemma by Goossens (1973:72). 208
Figure 118. Repetition of a part of our stemma; again the dots ‘...’ point to the fact that some texts have been removed. 208
Figure 119. Output in Appendix C, *Lanseloet* verses 02.0203: Goossens (1973) uses the presence of ‘die’ in text 02 and the absence of it in texts 01, 04, 05, 07 and 08 to demonstrate that text 02 is not immediately related to these five texts; characteristic 11a says that the presence/absence of small words does not provide text-genealogical information. 210
Figure 120. Output in Appendix C, *Lanseloet* verses 02.0014: Goossens (1973) uses the absence of the small word ‘so(e)’ in texts 01, 04 and 05 as the first argument to demonstrate that these texts are closely related; characteristic 11a warns us that the presence or absence of small words does not provide text-genealogical information. 211
Figure 121. Output in Appendix C, *Lanseloet* verses 02.0044: Goossens (1973) uses the agreement of the pronouns ‘vs’/‘ws’ (i.e. ‘us’/ ‘uus’) in texts 01, 04 and 05 as the second argument for the close relationship of these three texts; characteristic 4b warns us that it is dangerous to use a.o. pronouns for text-genealogical purposes. 211
Figure 122. Output in Appendix C, *Lanseloet* verses 02.0048: Goossens (1973) uses the presence of the adverb ‘Och’ in texts 01, 04 and 05 as the third argument to demonstrate that these three texts are closely related; characteristic 4b warns us that it is dangerous to use a.o. adverbs for

text-genealogical purposes; furthermore, ‘Och’ is a small word, which would be ruled out by characteristic 11a. 212
Figure 123. Output in Appendix C, *Lanseloet* verses 02.0062: Goossens (1973) uses the presence of the article ‘den’ in texts 01, 04 and 05 as the fourth argument to demonstrate that these three texts are closely related; characteristic 4b warns us that it is dangerous to use articles for text-genealogical purposes. 212
Figure 124. Output in Appendix C, *Lanseloet* verses 02.0185: Goossens (1973) uses the absence of the pronoun ‘ich’ in text 07 to show that text 07 is not the immediate forefather of text 08; however, this missing pronoun can be restored quite easily. 214
Figure 125. Output in Appendix C, *Lanseloet* verses 02.0319: Goossens (1973) uses the presence of ‘cheder’ in text 07 to show that text 07 is not the immediate forefather of text 08, which has ‘weder’; however, the reading of ‘cheder’ does not make much sense. 214
Figure 126. Output in Appendix C, *Lanseloet* verses 02.0206: Goossens (1973) uses the presence of ‘ducki vil’ in text 07 to show that text 07 is not the immediate forefather of text 08, which has ‘duck wijl’; however, the difference between both variants is rather small or trivial. 214
Figure 127. Output in Appendix C, *Lanseloet* verses 02.0287: Goossens (1973) uses the presence of ‘wars’ in text 07 to show that text 07 is not the immediate forefather of text 08, which has ‘wat is’; however, the difference between both variants is rather small. 215
Figure 128. Stemma by Goossens (1976). 216
Figure 129. Repetition of a part of our stemma. 216
Figure 130. Repetition of a part of our uncollapsed stemma, with the distances included (see fig. 110). 219
Figure 131. Repetition of a part of our collapsed stemma (see fig. 111). 219
Figure 132. A part of our collapsed stemma, with the distances included. 219
Figure 133. Stemma by Hüsken & Schaars (1976). VP1684 is our U/P=12; sG is our S/BO=14; VP1708 is our U/LE=13. 219
Figure 134. *Lanseloet* verses 02.0066 and 02.0067: text 13 mentions ‘Ende liggen dan’ twice; this dittography is evidently incorrect; it shows that text 13 cannot have been the immediate forefather of texts 12 and 14. 220
Figure 135. Output in Appendix C, *Lanseloet* verses 02.0479: Hüsken & Schaars (1984) use the presence of the adverb ‘O’ in text 13 and of the presence of the adverb ‘Och’ in texts 12 and 14 for text-genealogical purposes; characteristic 4b forbids to work with adverbs for the development of chains; besides, ‘O’ and ‘Och’ are small words, forbidden by characteristic 11a. 221
Figure 136. *Lanseloet* verses 02.0524 and 02.0525: in text 14 ‘rechte waerheyt’ is present, while texts 12 and 13 have rechtvaerdigheyd(t)’; it is remarkable that the text 14 variant is also present in handschrift Van Hulthem (text H/BR=01). 222
Figure 137. (Repetition of a part of fig. 91:) The definite chain of *Lanseloet van Denemerken*, without the ‘distances’ on the lines of connection. 225
Figure 138. Output in Appendix C, *Lanseloet* verses 02.0966: in the upper right part the original verses, in the upper left part the shorthand version of these versions, and in the lower part the variation formulas. 227
Figure 139. Appendix C, *Lanseloet* verses 02.0497: a noun ‘heer’ can change into (an adverb ‘ho’) 234

Figure 140. Appendix C, *Lanseloet* verses 02.0866 (concerning the adjectives 'swar' and 'grot'). 237
Figure 141. An alternative stemma for the *Lanseloet van Denemerken* texts versions, in which texts 04 and 05 (or a forefather of them) are contaminated with text 01 (or a forefather or descendant of it), as is expressed by the dotted line. 239
Figure 142. Appendix C, *Lanseloet* verses 02.0392: the ungenealogical spread of the adverbs 'aldus' and 'dus'. 241
Figure 143. Appendix C, *Lanseloet* verses 02.0655: the ungenealogical spread of the adverbs 'sere' and 'so'; notice that the variation places are not completely the same. 241
Figure 144. Appendix C, *Lanseloet* verses 02.0657: the ungenealogical spread of the adverbs 'nergens' and 'niuwers'. 242
Figure 145. The *Lanseloet* stemma with the variants 'nergens' and 'nye(u)wers'/'nieuwers' at verses 02.0657 (see fig. 144) filled in; the appearance of 'nergens' in the Cologne branch and in text 10 is coincidental, caused by parallelism. 243
Figure 146. Masculine flexion in the Middle Ages, *Twe-spraack* (1584) and 16th/17th century. 244
Figure 147. Feminine flexion in the Middle Ages, *Twe-spraack* (1584) and 16th/17th century. 245
Figure 148. Neuter flexion in the Middle Ages, *Twe-spraack* (1584) and 16th/17th century. 245
Figure 149. Appendix C, *Lanseloet* verses 02.0492: one of the many occurrences in text 10 of the male genus-'den' in subject position. 247
Figure 150. Appendix C, *Lanseloet* verses 02.0345: an example of the male genus-'den' in text 14 in subject position. 248
Figure 151. Appendix C, *Lanseloet* verses 02.0906: an example of the potentially ungenealogical, parallelistic character of the flexion of the indefinite article 'een'; the unrelated (not being an end group) texts 01, 12 and 13 have 'e(e)ne' in common. 248
Figure 152. Appendix C, *Lanseloet* verses 02.0062: an example of the ungenealogical, parallelistic character of 'die' and 'de(n)'. 249
Figure 153. Appendix C, *Lanseloet* verses 02.0974: the occurrence of 'dat' in texts 10 and 14 is ungenealogical, not in agreement with our chain/stemma. 250
Figure 154. Appendix C, *Lanseloet* verses 02.0316: an example of the change of 'die kamer' in 'een kamer'; notice that this example does not show that such change is ungenealogical. 250
Figure 155. Appendix C, *Lanseloet* verses 02.0310: an example of the ungenealogical character of the gender of a substantive. 252
Figure 156. Appendix C, *Lanseloet* verses 02.0276: an example of the ungenealogical character of the (shorthand) auxiliaries 'wil' and 'mot'. 253
Figure 157. Appendix C, *Lanseloet* verses 02.0149: an example of the ungenealogical character of the (shorthand) auxiliaries 'wilde' and 'wawde'. 255
Figure 158. Appendix C, *Lanseloet* verses 02.0675: an example of the ungenealogical character of the (shorthand) auxiliaries 'sin' and 'is'. 255
Figure 159. Appendix C, *Lanseloet* verses 02.0200: an example of auxiliaries changing tense. 256
Figure 160. Appendix C, *Lanseloet* verses 02.0347: another example of auxiliaries changing tense. 256

Figure 161. Appendix C, *Lanseloet* verses 02.0939: the old conjunction ‘ende’ is replaced by the modern conjunction ‘en’ in an ungenealogical way, because a group 09-12-13- is not present in our chain/stemma. 257
Figure 162. Appendix C, *Lanseloet* verses 02.0629: the conjunction ‘don’ is replaced by ‘do’ (or vice versa) in an ungenealogical way, because a group 01-09-10- does not exist in our chain/stemma. 258
Figure 163. Appendix C, *Lanseloet* verses 02.0673: the difference between ‘ofte’ and ‘oft’ is very small, by which it becomes difficult to draw conclusions about the parallelistic character of these conjunctions. 258
Figure 164. Appendix C, *Lanseloet* verses 02.0128: an example of the ungenealogical character of the preposition ‘te’ in texts 02 and 14. 259
Figure 165. Appendix C, *Lanseloet* verses 02.0185: the (shorthand) preposition ‘vor’ has changed in an ungenealogical way into ‘dan’, because group 09-14- is not a end group in our chain/stemma. 260
Figure 166. Appendix C, *Lanseloet* verses 02.0977: an example of the ungenealogical character of the pronoun ‘myn’/‘mijn’ in texts 09 and 14. 260
Figure 167. Appendix C, *Lanseloet* verses 02.0110: an example of the ungenealogical character of the pronoun ‘hen’ in texts 10 and 11; probably, the medieval (masculine and feminine) plural pronoun ‘hem’ was understood as a (masculine singular pronoun in the 16th and later centuries. 262
Figure 168. In the Middle Ages ‘hem’ was used in the plural; gradually the plural ‘hem’ disappeared; it is no longer mentioned as such in the *Twe-spraack* from 1584. 263
Figure 169. Appendix C, *Lanseloet* verses 02.0672: an example of the ungenealogical character of the pronoun ‘het’, occurring in the ungenealogical group 01-04-05- (see also §5.3.4.2.2.). 263
Figure 170. Does the archetypus have ‘het’? 264
Figure 171. Three *Lanseloet* formulas, mentioned earlier in fig. 71. 266
Figure 172. Appendix C, *Lanseloet* verses 02.0168: the variation formula 01-02-05-06-07-08-|09-10-11-12-13-14- would not have been detected without the shorthand text. 268
Figure 173. Appendix C, *Lanseloet* verses 02.0988: an example of the ungenealogical character of punctuation or the use of capitals or small letters. 268
Figure 174. Appendix C, *Lanseloet* verses 02.0073: characteristic 6a filters out the ungenealogical variants ‘got’ and ‘gode’. 269
Figure 175. Appendix C, *Lanseloet* verses 02.0915: characteristic 6a filters out the ungenealogical variants ‘ligt’ and ‘liget’. 269
Figure 176. Appendix C, *Lanseloet* verses 02.0959: an example of the virtue of splitting words in the shorthand text; ‘afnam’ occurs in the original, non-shorthand, texts as one, undivided word in the ungenealogical group 04-05-14-. 270
Figure 177. Appendix C, *Lanseloet* verses 02.0488: the software splits up ‘edelvrouwe’ in text 10 into two parts; otherwise, text 10 could not have been mentioned in the highlighted formula (= formula 21 in fig. 71). 271
Figure 178. Appendix C, *Lanseloet* verses 02.0204: the word ‘minue’ in text G/L=02 is an evident error; we may read it as ‘minne’, and add text 02 to the highlighted formula by hand. 272

Figure 179. Appendix C, *Lanseloet* verses 02.0397: a first indication that characteristic 8 on word order is incorrect. 279
Figure 180. Appendix C, *Lanseloet* verses 02.0403: a second indication that characteristic 8 on word order is incorrect. 280
Figure 181. Appendix C, *Lanseloet* verses 02.0665: an example of the preference of the German texts 06-07-08- for the (shorthand) word 'lifde' instead of 'minne'. 241
Figure 182. Appendix C, *Lanseloet* verses 02.0666: verses following verses 02.0665 (see previous fig. 181). 283
Figure 183. Appendix C, *Lanseloet* verses 02.0232: an example to demonstrate that duplicate rhyming words can occur in ungenealogical groups. 285
Figure 184. Appendix C, *Lanseloet* verses 02.0233: verse following verse 02.0232 (see previous fig. 183). 285
Figure 185. Appendix C, *Lanseloet* verses 02.0242: an example of the genealogical character of omission/addition of words. 288
Figure 186. Appendix C, *Lanseloet* verses 02.0132: another example of the genealogical character of omission/addition of words. 288
Figure 187. Appendix C, *Lanseloet* verses 02.0009: the omission/addition of the shorthand word 'over' is in agreement with our chain/stemma. 289
Figure 188. Appendix C, *Lanseloet* verses 02.0118: now the omission/addition of the shorthand word 'over' is not in agreement with our chain/stemma. 289
Figure 189. The stemma of *Lanseloet van Denemerken*, emphasizing the presence of the word 'over' in the 02.0118 verses (see previous fig. 188). 290
Figure 190. Appendix C, *Lanseloet* verses 02.0229: the absence (not necessarily a deletion, because the archetypus reading cannot be easily determined) of the small word 'so' in texts 01 and 05 - together not a family - is ungenealogical. 291
Figure 191. Appendix C, *Lanseloet* verses 02.0289: the absence of the small word 'o' in texts 01-04-05-10 is ungenealogical. 292
Figure 192. Appendix C, *Lanseloet* verses 02.0425: the presence of the small word 'so' in texts 09-10-11-12-13- is ungenealogical. 292
Figure 193. Appendix C, *Lanseloet* verses 02.0508: the presence of the small word 'wel' in texts 05-14- is ungenealogical. 293
Figure 194. Appendix C, *Lanseloet* verses 02.0805: the presence of the small word 'die'/'den' in texts 01-14- is ungenealogical. 293
Figure 195. Appendix C, *Lanseloet* verses 02.0655 (see also fig. 143): the presence of the four character word 'sere' in texts 01-09- is ungenealogical. 294
Figure 196. Appendix C, *Lanseloet* verses 02.0039: an example of the detection of the absence of verses, here in group 09-11-12-13-14-. 295
Figure 197. Appendix C, *Lanseloet* verses 02.0082: an example of the detection of the addition of verses, here in group 11-12-13-14-. 295

LIST OF PICTURED *LANSELOET* VERSES

If in the list below a figure number is *in italics*, this means that the figure has been copied from Appendix C. Therefore, such figure (in italics) offers: a. the original *Lanseloet* verse, as present in the fourteen text versions; b. its 'shorthand' version; c. the output (*i.c.* the variation formulas) as generated by the computer software. (In Appendix A it is explained in detail how the computer software treats verses 02.0007 to 02.0022.)

02.0007 - 02.0022: Appendix A.

CURRICULUM VITAE

Benedictus Johannes Paulus Salemans was born in Maastricht, the Netherlands, on 10 December 1955. He attended a.o. Sint Maartenscollege, Maastricht (Atheneum A, 1976). From 1976, Salemans studied Dutch language and literature at the Univerisity of Nijmegen, where he graduated cum laude in 1985 (on Middle-Dutch literature and on computer linguistics). During the following three years, he was junior researcher at the Department of Dutch, at the same university. From 1988 to 1995, he was employed at the UCI, the university computer center in Nijmegen, a.o. as the head of the department of computer applications. Since 1995, he has worked at the Communication Office of the University of Nijmegen, where he is responsible for the university web-site http://www.kun.nl/. Since 1980 Salemans has tried to stimulate the use of the computer in the humanities by several publications and computer programs. In 1992, he started Neder-L, the first electronic computer magazine for Dutch language and literature (Internet URL: http://baserv.uci.kun.nl/~salemans/).

APPENDICES

OF THE

DISSERTATION

OF

B.J.P. SALEMANS

NIJMEGEN 2000

Table of Contents

Appendix A: Description of the Eight Steps the Software Performs: from the Fourteen Single Text Versions to the Variation Formulas 1

Appendix B: Guide to the Interpretation of the Computer Results and Output 41

Appendix C: The Computer Results: the Synoptic *Lanseloet van Denemerken* Text Versions and the Variation Formulas 69

Appendix D: Presentation of the Variation Formulas, Ordered by Characteristics 389

Appendix E: English Translation of Parts of Salemans (1987) on Cladistics 601

Appendix F: The Fourteen Synoptic *Lanseloet van Denemerken* Text Versions 613

APPENDIX A: Description of the Eight Steps the Software Performs: from the Fourteen Single Text Versions to the (Potential) Variation Formulas

TABLE OF CONTENTS OF APPENDIX A

PART 1: CREATE A SYNOPTIC TEXT EDITION OF THE *LANSELOET VAN DENEMERKEN* TEXT VERSIONS
- Step 1: Find the Rhyming Pairs of the Fourteen *Lanseloet van Denemerken* Text Versions
- Step 2+3: Take the Rhyming Pairs of Text 02 as a Basis (= step 2) and Compare These with the Rhyming Pairs of the Thirteen Other Texts (= step 3)
- Step 4: Combine these Thirteen Comparisons into One Complete Scheme of All the Rhyming Pairs of the Fourteen Texts, Taking the Rhyming Pairs of Text 02 as a Starting Point
- Step 5: Find the Rule Numbers of the Lines of the Synoptic Text on the Basis of the Complete Scheme of All the Rhyming Pairs
- Step 6: Build the Synoptic Text, Containing the Original Texts of the Fourteen *Lanseloet van Denemerken* Text Versions, with the Use of the Detected Rule Numbers

PART 2: CREATE A 'SHORTHAND TEXT' OUT OF THE SYNOPTIC TEXT EDITION
- Step 7: Rewrite the Synoptic Text into a Shorthand Text, in which many Orthographical Peculiarities have been Removed or Simplified

PART 3: DEVELOP THE VARIATION FORMULAS TO BUILD THE TEXT-GENEALOGICAL TREE WITH
- Step 8: Detect Text-Genealogically Informative Type-2 Variants, and Develop (Potential) Type-2 Variation Formulas from them

PART 1: CREATE A SYNOPTIC TEXT EDITION OF THE *LANSELOET VAN DENEMERKEN* TEXT VERSIONS

Part 1, Step 1: Find the Rhyming Pairs of the Fourteen *Lanseloet van Denemerken* Text Versions

The very first action of my research was to transcribe diplomatically the fourteen texts of *Lanseloet van Denemerken*. These transcripts were collated ten times. (More information about these fourteen texts and about the diplomatic transcription can be found in the first two parts/chapters of Appendix B.) A computer program has added at the start of each line of the texts unique line numbers.

To enable the (automated) detection of differences between these texts, it is necessary to create a synoptic edition of the fourteen texts. In this synoptic text one verse of a text (in our case 02) is accompanied by the corresponding verses of the thirteen other text versions.
Generally, the *Lanseloet* text versions consist of clauses spoken by the players, who are announced by clause headers. The clauses consist of rhyming verses. The position of the final rhyming words of a clause have a steady position. They cannot be easily altered by copyists, because the rhyme scheme may not be violated. The computer considers the *Lanseloet* text versions as a string of 'shortened clauses'. Each shortened clause consists of the clause header followed by a string of final words of the verses of that clause. The rhyming pairs are put between brackets () and preceded by the line number in which the first word (or the word pointed at by an arrow '=>' or '<=') of a rhyming pair can be found. The automated process to build such 'shortened clauses' out of the transcribed texts is the first step my software takes.

Below, in the left columns parts of the fourteen original *Lanseloet* texts are printed. The parts concern the first clause of Lanseloet, then the first clause of Sandrijn, then the second Lanseloet clause and then the first line of the second Sandrijn clause. At the right the

'shortened clauses' have been printed, as generated by the first software step. Words that do not rhyme optimally have been surrounded by the computer with the (warning) signs '#'. If one rhyming word ends with a schwa followed by an 'n', while the other rhyming word seems to rhyme optimally but does not have such final 'n', both words are considered to be good rhyming words. Then, no warning signs are printed.

Part 1, Step 2+3: Take the Rhyming Pairs of Text 02 as a Basis (= step 2) and Compare These with the Rhyming Pairs of the Thirteen Other Texts (= step 3)

The result of the first step consists of fourteen sets of shortened clauses, one set for each text version. In step 2 we decide at random that the shortened clauses of text 02 are the basis shortened clauses. In step 3 we let the computer compare the clauses of the other thirteen texts with the clauses of text 02: the computer compares the basis clauses of 02 with the clauses of 01, the ones of 02 with 03, 02 with 04, 02 with 05, 02 with 06, 02 with 07, 02 with 08, 02 with 09, 02 with 10, 02 with 11, 02 with 12, 02 with 13, and 02 with 14.

Some remarks about abbreviations in the boxes:

- The line numbers of base text 02 are preceded and clearly marked by a star '*'
- Sometimes remarks between brackets and stars '(* ... *)' are offered behind a set of rhyming words (not behind the words of base text 02). Between the final star and the final bracket ')' extra notations can be placed.
  In the remarks:
  . '**A1**' must be interpreted as 'the first word of the pair of base text 02'
  . '**A2**' as 'the second word of the pair of text 02'
  . '**B1**' as 'the first word of the pair of the other, non-base text'
  . '**B2**' as 'the second word of that pair'
  . '**shoA1**' as 'the shorthand, simplified version of A1'; in part II of Appendix B, under the header 'The shorthand version of the diplomatic synoptic text (etc.)', will be explained, roughly speaking, that in the shorthand version of a word or verse the vowels consisting out of two or more vowel characters are shortened into vowels consisting of a single vowel character and that some combinations of more than one consonant are shortened

into a single consonant character

. '**shoA2**' as 'the shorthand, simplified version of A2'
. '**shoB1**' as 'the shorthand, simplified version of B1'
. '**shoB2**' as 'the shorthand, simplified version of B2'
. '=' as 'equals', 'is'
. '=^' as 'differs from', 'is not'
. '***INV***' as 'the words of this text have the opposite, inverted, order of the words of the base text'
. '***DBL***' as 'the words of this rhyming pair are both the same; therefore, it is likely that normal rhyming conventions are violated here; possibly, this is a spot at which the transmission process went wrong' (not pictured in the examples below)
. '**<part-of>**' as 'is equal to a part of'; before '<part-of>' the word is printed that is a part of the word that is behind '<part-of>'
. '**1word.in.common**' as 'both couples of the non-base text and the base text have one word in common; therefore the couples are considered to be more or less equal (for the process to build a synoptic text)'. The '*1word.in.common*' is followed by the codes that inform us which word they have in common; '(*1word.in.common*A1B2)', e.g., informs us that the first word of the base text pair equals the second word of the non-base text pair.
. '**n.o.**' as 'the (non-base) text is not delivered here'; it is the shorthand of the Dutch 'niet overgeleverd', 'not delivered'; the pages have disappeared; we do not know their original (vanished) contents; as explained on the first page of appendix B, we only have fragments of texts 03, 04 and 14. Because the top of many delivered pages of these fragmented texts can start in the middle of a clause, I told the computer to which clause (of the base text) these first lines of new pages of the fragmented texts belong. (A more elegant, but more difficult, solution would have been to compare the delivered parts of fragments of texts 03, 04 and 14 with fragments of clauses of base text 02.)
. '**@**' = 'absent rhyming word/verse in the non-base text'. When a non-base text does not contain lost pages (= 'n.o.'), it is possible that in this text one or more verses are missing, caused, for instance, by errors of copyists or printers. There is a difference between non-visible absences of non-delivered text fragments of texts (= 'n.o.'), which were possibly present in the complete versions of these texts, and clearly visible absences of verses in text versions of which no pages are missing. In the n.o.-case we do not know whether a non-delivered verse did occur in the complete text version; we cannot draw conclusions from non-delivered texts fragments. Notice, therefore, that the notion 'absence' is relative, and related to the choice of the base text. When a non-base text does not have a verse that is present in the base text, we say that we have detected an 'absent' verse in a non-base text, which is marked by the sign '@'. Of course it is possible that the base text has an extra, interpolated verse. For the process of building a chain of text versions, the relativity of the notions 'absence' and 'presence' is irrelevant. When the base text is compared with the other texts, the base text is considered to be 'the' complete text with all the verses. In the process of comparing the base text with the non-base text versions, the base text cannot contain extra or missing verses; the other non-base texts are considered to contain absent or added verses.
. '**2=2**' (behind a couple in the non-base text) as 'the current couples of the base and non-base text do not match; but because the next couples of both texts match, the current couples of the base text and non-base text are considered to match as well'.
Roughly speaking, when a couple 'first:(x1-x2)' of the base text is not equal to a couple 'first(y1-y2)' of the non-base text, the procedure is as follows. [Do not understand the word 'couple' in a too absolute sense: a clause-header, the first or last verses that do not

rhyme with other verses within that clause, a single verse that does not rhyme with another verse, they all are considered to be a ‘couple’ (or textual unit) as well.]
First, the current couple ‘first:(x1-x2)’ is compared with the next couple of the non-base text: ‘second(y1-y2)’; when ‘first(x1-x2)’ is (more or less) equal to ‘second(y1-y2)’ it is likely that the ‘first(y1-y2)’ couple are extra verses or that a couple of verses in the base text are missing. When this first test fails, a new, second, test will performed: the next couple of the base text ‘second(x1-x2)’ will be compared with the current couple of the non-base text ‘first(y1-y2)’; when ‘second(x1-x2)’ is (more or less) equal to ‘first(y1-y2)’ it is likely that the ‘first(x1-x2)’ couple are extra verses, or that two verses in the non-base text are missing. When this second test fails, ‘second(x1-x2)’ and ‘second(y1-y2)’ are compared; when they match, which will be expressed with ‘2=2’ behind the second couple of the non-base text, ‘first(x1-x2)’ will be considered to agree/match with ‘first(y1-y2)’

. ‘**2=1**’ (behind a couple in the non-base text) as ‘the next couple of the non-base text matches the current couple of the base text’, by which the absence of one or more verses in the non-base text is detected. This absence is marked with a couple ‘(@ - @)’ (see below: the comparison of base text 02 with text 01, near 02.22), when the base text has two words in the couple, or by ‘(@)’ when the base text has a couple consisting of one verse. I repeat, that it is, of course, possible that the base text contains extra verses. Notice that the first number, before the ‘=’-sign of ‘2=1’, refers to the non-base text and the second number to the base text.

Analogously, ‘1=2’ means: ‘the current couple of the non-base text matches the next couple of the base text’ (by which an added couple of verses in the non-base text is detected). Furthermore, ‘2=3’ (not present in the examples below) would imply that the next couple of the non-base text is equal to the next next couple of the base text.
We see that in this way the software can ‘jump’ maximally two couples or four verses to see whether (next) verses resume matching.

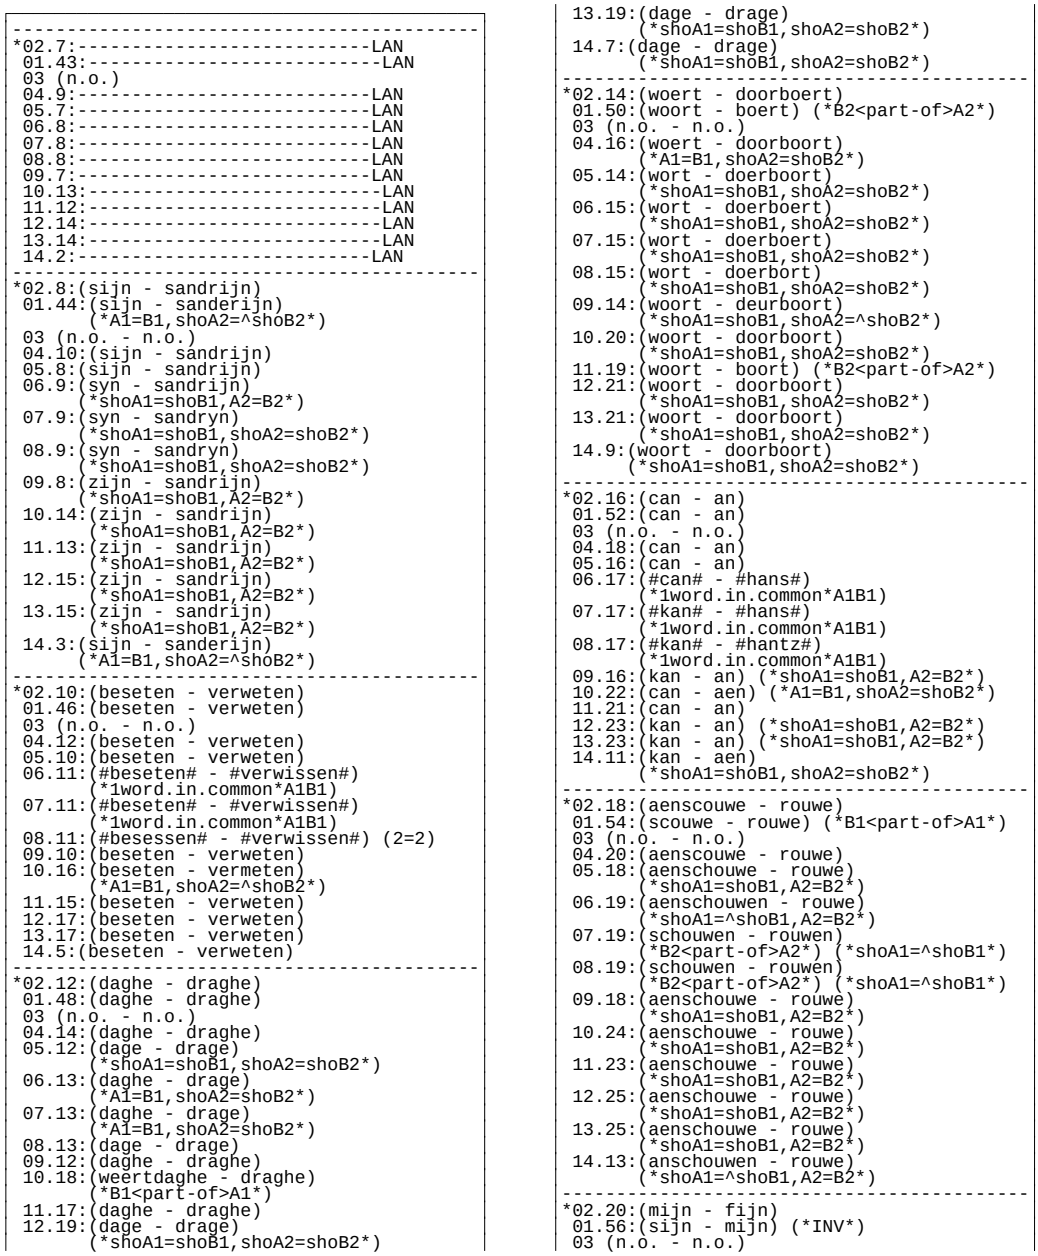
Part 1, Step 4: Combine these Thirteen Comparisons into One Complete Scheme of All the Rhyming Pairs of the Fourteen Texts, Taking the Rhyming Pairs of Text 02 as a Starting Point

Step 3 resulted in thirteen sets printed in the thirteen boxes. In each set the final words of a clause of base text 02 are offered, followed by the accompanying words of one other non-base text. These thirteen sets can be rewritten into one large set quite easily, based upon their common parts: the base text line numbers. This rewriting process is performed in the fourth step, as pictured below.



```

Part 1, Step 5: Find the Rule Numbers of the Lines of the Synoptic Text on the Basis of the Complete Scheme of All the Rhyming Pairs the rhyming pairs

With the results of step 4 at hand we can derive the numbers of the rules of the texts that belong together. These rule numbers are printed below.

Part 1, Step 6: Build the Synoptic Text, Containing the Original Texts of the Fourteen *Lanseloet van Denemerken* Text Versions, with the Use of the Detected Rulenumbers

In the boxes below the results of the sixth, seventh and eighth step are visualized together. For each verse of the base text a separate box has been designed by the computer. Each box consists of three parts: 1. an upper part, with in the right the original texts (as a results of step 6) and in the left the shorthand texts (as a result of step 7); 2. a middle part with 'Observations and type-2 variant groups' (as a result of step 8a); 3. a lower part with 'Variation formulas' (as a result of step 8b).

During the **sixth step** all the rules of all the texts are gathered by the computer into one 'overall' text, with the rulenumbers detected during the fifth step as a guide. In other words, in the sixth step the synoptic text, is established, built from the fourteen original text versions. The original lines of the texts are printed in the right part of the pictures, behind, or to the right of, the sign '<'. We can see, for instance, that the seventh line of text 02 contains the clause header 'Lantsloet', while, for instance, the accompanying verse of text 01 (with line number 01.43) has '@ lanseloet'. In 'The Diplomatic Transcription' of part II of Appendix B will be explained how certain parts of the synoptic text must be interpreted. We will see there, amongst others, that elements between right brackets '[]' or '<>' have been added by me.

PART 2: CREATE A 'SHORTHAND TEXT' OUT OF THE SYNOPTIC TEXT EDITION

Part 2, Step 7: Rewrite the Synoptic Text into a Shorthand Text, in which many Orthographical Peculiarities have been Removed or Simplified

In the **seventh step** the original verses at the right of the '<' sign are rewritten into shorthand notation. This process will be explained in detail in Appendix B as well, in the second part of part II, called 'The Shorthand Version of the Diplomatic Synoptic Text, Generated by the Computer'. The aim of this process is to get rid of 'trivial' spelling differences. We will see there, for instance, that capital characters are transformed in the shorthand version into small characters, that punctuation signs and paragraph signs ('@') are removed, and that combinations of vowels are be rewritten as one vowel (character). It will be clear that the '<' sign is (a part of) an arrow that denotes that the part behind it is transformed into the part before it.

PART 3: DEVELOP THE VARIATION FORMULAS TO BUILD THE TEXT-GENEALOGICAL TREE WITH

Part 3, Step 8: Detect Text-Genealogically Informative Type-2 Variants, and Develop (Potential) Type-2 Variation Formulas from them

The **eighth step** takes the shorthand text of the seventh step as input. Roughly speaking, the eighth step consists of two parts.

First, during step 8a, **type-2 variant groups** are detected. The computer looks at all the occurrences of words in all the texts. A word is considered to be a string of low case characters, preceded (and followed by a blank character or 'space'). Two words are different words when these strings are not totally equal. In other words, at this stage the computer

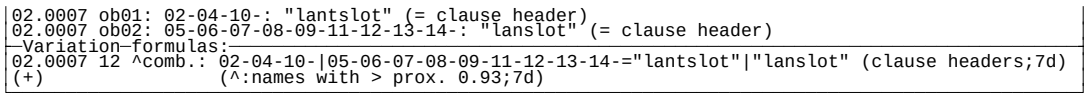
considers the words ‘Lantsloet’ and its genitive ‘Lantsloets’ to be totally different words. In the first part of the eighth step, the computer acts as follows. It takes a word from the first text available and looks if this word occurs in other texts as well. The computer will score the text numbers in which a word occurs. For instance, in the example below, near verse 02.7, the computer will detect that 1. the word ‘lantslot’ occurs in texts 02, 04 and 10; 2. ‘lanselot’ occurs in 01; 3. ‘lanslot’ appears in texts 05-06-07-08-09-11-12-13-14. We do not know how text 03 looked here, since the contents of this text is not present anymore for this verse. As explained else in this book, I will use type-2 variation formulas to build the text tree of *Lanseloet van Denemerken*. A type-2 variation formula consist of two true groups of texts in which two competitive variants are present. A true group is a group consisting of at least two members. In other words, in a type-2 variation formula can never occur: single groups, consisting of only one member, and groups consisting of all the present texts minus one text. Therefore, the computer knows that the observation that ‘lanselot’ occurs in a single text 01, can never lead to or can never be part of a type-2 variation formula, since it does not belong to a true type-2 group. Eventually, the result of the first part of the eighth step will be a list of words/variants occurring in (true) text groups.
Second, during step 8b, the observed type-2 variant groups are combined into **(potential) type-2 variation formulas**. All the combinations of all the type-2 variant groups into such formulas are possible, although it will be clear that when two type-2 variant groups have one or more texts in common, they cannot be combined. Take, for instance, the first observed type-2 variation group near verse 02.0008. The (shorthand) word ‘a’ occurs in texts 01-02-04-05-09-10-11-12-13-14- and the (shorthand) word ‘dat’ occurs in texts 02-06-07-08-14-. A variation formula that would express that a group like 02-06-07-08-14- has one (variant) word while 01-02-04-05-09-10-11-12-13-14- has a competitive (variant) word is nonsense: both ‘a’ and ‘dat’ occur in texts 02 and 14. Therefore, we know that ‘a’ and ‘dat’ cannot be considered to be (competitive) variants of each other.

In the theoretical part of my dissertation I have claimed that text-genealogical variants must be in accordance with eleven characteristics (with sub-characteristics). I have taught the computer to recognize these characteristics. When two true groups of texts are combined into a potential type-2 variation formula, the computer will test whether both variants of the formula are not in conflict with one or more of these characteristics. When one or more characteristics are violated, the computer will reject the potential variation formula, denoted by ‘^comb.’. In part III of Appendix B, called ‘Information about the Computer Generated Formulas Expressing (Non-)Genealogical Relations between the *Lanseloet van Denemerken* Text Versions’, will be explained in detail how the computer generated (potential) type-2 variation formulas must be interpreted. I will give comments about the way the computer acts right after the pictures below.

Verses near 02.7 and comments

Now we will look at the computer output, starting with the verses near verse 02.7.

```
02.7  lantslot                          < 02.7       Lantsloet              [fo.-A2r-][1]
01.43 lanselot                          < 01.43      @ lanseloet                    [37]
05.7  lanslot                           < 05.7       [Lansloot]             [fo.-A2r-]
06.8  lanslot                           < 06.8       Lansloot
07.8  lanslot                           < 07.8       Lansloot
08.8  lanslot                           < 08.8       Lanslot
09.7  lanslot                           < 09.7       [Lanslot]              [fo.-A1v-]
10.13 lantslot                          < 10.13      [Lantslot]             [fo.-A1v-]
11.12 lanslot                           < 11.12      Lanslot.
12.14 lanslot                           < 12.14      Lanslot.
13.14 lanslot                           < 13.14      Lanslot.
03*                                     < 03=>*
04.9  lantslot                          < 04.9       [Lantsloot]            [fo.-A2r?-]
14.2  lanslot                           < 14.2       Lanslot
--Observations/type-2-variants:-------------------------------------------------------
```



02.0007 ob01: 02-04-10-: "lantslot" (= clause header)
02.0007 ob02: 05-06-07-08-09-11-12-13-14-: "lanslot" (= clause header)
Variation formulas:
02.0007 12 ^comb.: 02-04-10-|05-06-07-08-09-11-12-13-14-="lantslot"|"lanslot" (clause headers;7d)
(+) (^:names with > prox. 0.93;7d)

A lot of information is presented is this picture. How should we interpret it?

The original contents of the text versions

We see the original lines at the right upper part of the picture above. The clause header has been added by me in texts 04, 05, 09 and 10, as marked by the brackets '[]'. The text between these brackets have been derived from other places in these texts, in which a equivalent clause header is present. Adding textual information in a diplomatic edition must be avoided! However, as has been explained above, my software to build a synoptic edition of the 14 *Lanseloet* text versions depends on clauses, starting with the name of the person that speaks out the clause. When the clause headers are absent, the software has a problem. Of course, I could have decided to adapt or refine my software and, for instance, teach the computer that a clause starts with a clause header and/or certain starting verses, and not only by a clause header. I decided not to change my software. The process of building a synoptic text is rather complex and asks for high programming skills and efforts. Yet, I consider this process to be rather trivial. At the start of my research I was impressed by the fact that I could write complex software to build a synoptic text. Later on I realized that I could have decided to build a synoptic text by hand. However, I am still pleased with my approach: the disadvantage of this manual approach to develop a synoptic text would be that the computer would not have detected automatically omissions, additions and inversions of verses. I simply decided to spend my time to more important text-genealogical matters and priorities. Possibly I will decide to refine my synoptic software after my dissertation has finished.

My own criticism of the violation of the diplomatic principles can be put aside, by pointing out that the brackets '[]' (see also Appendix B for the explanation of these and other elements) clearly indicate that I have added the information between them.

The shorthand versions of the original lines

In the left upper part of the figure above, we see the shorthand versions of the lines. We see that the clause headers between brackets occur in the shorthand lines. One could oppose now that in these lines is not visible that certain clause headers are not present in the original texts. However, in the theoretical part of this dissertation has been explained that the absence or presence of clause headers, and even of incorrect clause headers, is not genealogically important. Absent clause headers can be easily filled in by copyists or printers and incorrect headers can be easily corrected. In other words, they can be parallelistic and should not be used for text-genealogical purposes.

The shorthand version of the original names

One could oppose as well that in the shorthand version the original names 'Lansloot'/ 'Lansloet and 'Lanslot' are represented by one and the same shorthand word 'lanslot': an overgeneralization. The evaluation of the software results will show that when the differences between variants consists of vowels, this difference is genealogically unimportant. Furthermore, I want to stress again that my text-genealogical software, with its eleven text-genealogical characters built in, functions as a filter. Less than five percent of the variation formulas come through this filter and are offered to me as potentially interesting variation formulas. Of course I will look in the original texts if they are correct; variation formulas concerning information added by me in the original texts (between brackets '[]' or '<>') will be rejected by me, if they would not have been filtered out already.

The combination of detected type-2 groups into potential type-2 variation formulas

How does the computer treat the readings in the text versions? First, it will detect true type-2 variant groups. When ‘y’ is the total amount of texts having a contents, the next formula may help to find out whether a number ‘x’ of texts having the same variant is a true type-2 group: { 1 < number x < (y - 1) }. In our example, text 03 has no reading. Therefore, the amount of texts having a contents is ‘13’. Logically, under these conditions, the formula tells us that a true type-2 group consists of two or more texts, but less than 12 texts.

Now the computer detects: 1. (first observation or ‘ob01’:) the variant ‘lanslot’ occurs in texts 02-04-10-, a true type-2 group, because it has three members; 2. (second observation or ‘ob02’:) that the variant ‘lantslot’ is present in 05-06-07-08-09-11-12-13-14-, a true type-2 group as well. The computer ‘remembers’ that both variants are clause headers.

Then the computer starts to combine the detected type-2 groups into type-2 formulas, consisting of two true type-2 groups. Since in our example only two groups are detected, the only possible combination is detected quickly. The computer checks, whether both groups have unique text versions. When one group has one or more text versions that occur in the other group, both groups may not be combined into a formula. This will become more clear, when discussing the treatment of the verses near verse 02.8.

The result is a potential variation formula: comb.: 02-04-10-|05-06-07-08-09-11-12-13-14-="lantslot"|"lanslot".

Now the computer will check whether the variants in this formula are in accordance with the 11 characteristics as expressed in the theory.

Normally, one of the first things the software does is looking in the dictionary or thesaurus, to detect if one or both variants belong to ‘forbidden’ word classes (like pronouns, adverbs, etc.; see Appendix B, part III.a.4). However, this search in the thesaurus is not performed or is not necessary, because the variants concerned are standing in rhyming position; characteristic 5 tells us that the word class of words in rhyming position is not important. This is expressed by the part ‘(wds r.p;5)’ in the formula.

As expressed in part III.a.3 of Appendix B, I have taught the computer to recognize the names of Lanseloet, Sandrijn, Reinout, Johan, Jesus, Christ, Maria and Simon (and derived, inflected variant forms of these names). At a certain moment the computer start to test whether characteristic 7d, which expresses a.o. that a variant (like a name) may not be easily changed with another variant. In this case the computer detects that the variants ‘lantslot’ and ‘lanslot’ are both names that look very much alike: their proximity (see Appendix B, part III.a.3, under the head ‘Concrete examples of the sixth component’, the explanation of the meaning of ‘(^:names with > prox. ... ;7d)’. The proximity or ‘look-alikeness’ is high. Therefore, the computer considers both variants to be more or less unimportant variants of the same name.

(+)                (^:W1=Mx;W2=Mx;4b-)
```

Let us take a look at the two steps the computer performs.

The detection of (true) type-2 groups

First, the true type-2 groups are detected. Notice that the shorthand word ‘ho’ occurs in all the present text versions, except for precisely one text version; therefore, the group of texts in which ‘ho’ occurs is not a true type-2 group. Furthermore, ‘wi’ is only present in one text version, which is not a true type-2 group neither. (Notice as well that the combination of ‘ho’ and ‘wi’ into a variation formula, would lead to a result like 08|01- 02-04-05-06-07-09-10-11-12-13-14-="ho"|"wi", which is a type-1 formula, in which we are not interested.) During the first step, the computer detects four type-2 group variants: ‘a’, ‘dat’, ‘dit’ and ‘og’.

The determination of all the potential type-2 variation formulas

In the next step, the computer starts to combine the detected type-2 variant groups. The following combinations are possible: 1. ‘a’ and ‘dat’; 2. ‘a’ and ‘dit’; 3. ‘a’ and ‘og’; 4. ‘dat’ and ‘dit’; 5. ‘dat’ and ‘og’; 6. ‘dit’ and ‘og’. Some combinations can be rejected immediately. Combination 1, e.g., can be rejected because both variants occur in text 02 (and 14), by which the computer knows that the variants concerned cannot be competitive variants, or, to put it in other words, ‘a’ and ‘dat’ cannot be variants of each other. For analogous reasons combinations 2, 5 and 6 are rejected. The result is that only combinations 3 (‘a’ and ‘og’) and 4 (‘dit’ and ‘dat’) are potential type-2 variation formulas:

```
a. comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-="og"|"a"
b. comb.: 02-06-07-08-14-|01-04-05-09-10-11-12-13-="dat"|"dit"
```

Further testing of the type-2 variation formulas against the eleven characteristics of text-genealogical variants:

The test of formula a: rejected because both variants are adverbs (characteristic 4b)

Now the computer will test whether both potential variation formulas, are in accordance with the eleven characteristics of good text-genealogical variants.

First, we look at combination a. While testing the fourth characteristic, the computer looks in the thesaurus (see Appendix B, part III.a.4) of words and detects that ‘og’ is an adverb; the same goes for ‘a’. Therefore, both variants belong to the same word categories. Therefore, the condition as has been described in characteristic 4a has been fulfilled: according to the theory text-genealogical variants must belong to the same word categories, by which the computer analyses that condition or characteristic 4a is fulfilled. However, the theory considers only substantives and verbs to be significant word categories, as described

by characteristic 4b. Because one or both variants are adverbs, the characteristic 4b is violated. Therefore, the computer will eventually reject the potential variation formula a: it expresses that it is not a good variation formula (‘^comb’), for the reasons mentioned: ‘(^:W1=Av;W2=Av;4a+;4b-)’ (read: Word 1 in the formula, ‘og’, is an Adverb; Word 2, ‘a’ is an adverb; characteristic 4a is fulfilled (4a+); characteristic 4b is violated (4b-)). This leads to the complete formula:

```
02.0008 13 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-="og"|"a" (^:W1=Av;
W2=Av;4a+;4b-)
```

in which 02.0008 refers to the line number of base text 02, and ‘13’ is the number of text versions concerned.

The test of formula b: rejected because of characteristics 4b and 7b

Now we consider combination b, concerning ‘dat’ and ‘dit’. Again the computer will look in the thesaurus to check the word classes of ‘dat’ and/or ‘dit’. The computer will see that both words belong to the Mixed word category Mx. This Mixed word category must be explained. A shorthand word like ‘en’ can be derived from the original word ‘en’, a.o. a conjunction, and ‘een’ a.o. an article. Let us simply say that ‘en’ can be a conjunction or an article. Therefore we know that ‘en’ cannot be a substantive or a verb, the word categories we are interested in for our text-genealogical goals. When we could have used a automatic syntactic parser, it would have been possible, most of the time, to determine whether ‘en’ is an article or a conjunction. Since such parser did not exist, I decided to build in the thesaurus a Mixed word category, with ambivalent (= belonging to more than one word category) words that are not nouns or substantives. When the computer encounters a variant present in the Mixed category, it knows that this is a ‘forbidden’ word category as well, since the word cannot be a substantive or a verb.

When we return to our concrete example, we see that both shorthand words ‘dat’ and ‘dit’ belong to the word category Mx: ‘dat’ can be a pronoun and a conjunction, while ‘dit’ can be a pronoun or the shorthand notation of the word ‘diet’, which is a contraction of ‘die’ and ‘het’ (both words are not verbs or substantives). One could claim now that ‘dat’ can be the shorthand notation of the substantive ‘daad/daet’ (in English, an ‘act’). However, I checked whether this potential substantive ‘dat’ (and other words belonging to the Mx category) could be part of type-2 variation formulas: in 99 or more percent, the word is not a substantive or verb. Therefore, I decided to consider it as to be a part of the non-substantive and non-verb Mixed category. (Admittedly, when the substantive ‘dat’ would have had occurred in a type-2 environment near a verse x, I would have taught the computer that ‘dat’ for that particular verse did not belong to the Mixed category.) My goal was and is to let the computer, based on the theory, filter out tens of thousands of useless incorrect variation formulas, and that only interesting, ‘huge’ variant formulas remain to build a chain or stemma with. And after having built such chain or stemma I also wanted to be able to evaluate whether the (theoretically) rejected or accepted variants, were rejected or accepted correctly. To enable such evaluation, I decided to let the computer express which characteristics it applied when considering a (potential) variation formula.

The computer detects that both ‘dat’ and ‘dit’ belong to the forbidden word category Mx. For that reason the variation formula of both shorthand words can be rejected. Furthermore, the computer detects dat ‘dat’ and ‘dit’ differ in their vowels. As has been expressed in the theory, I guess that when the difference between two variants consist of a difference between vowels, this difference is not text-genealogically important, as expressed by characteristic 7b: the difference should be considered to be small, unimportant or accidental. However, I have doubts on this matter, as expressed by ”I guess“ in the previous sentence. To put it into other words, I have small doubts whether the fact that the difference between two variants only differ in a vowel is reason enough to say that both

variants are unimportant variants. The procedure that I will perform to detect or evaluate whether characteristic 7b is adequate, will be as follows. In first instance, I will not use characteristic 7b cases as text-genealogically informants. I will let the computer draw the chain or stemma of the *Lanseloet* text versions without 7b variants or other variants about which I doubt the text-genealogical value of. Then I let the computer determine how stable or trustworthy this historical text tree is, having used variants about which I have fewer doubts. When this tree is trustworthy, I can investigate whether 7b variants are in accordance with this tree: when they are not, we could conclude that 7b variants are inadequate variants indeed.

I ordered the computer to express my small doubts on the text-genealogical value of characteristic 7b by a question mark. Notice, however, that the combination of the variants 'dat' and 'dit' will be rejected anyhow because they belong to the forbidden word class Mx. I hope the rejected (^comb) formula will speak for itself now:

```
02.0008    13    ^comb.:    02-06-07-08-14-|01-04-05-09-10-11-12-13-="dat"|"dit"
(?<:vow.; 7b) (^:W1=Mx;W2=Mx;4b)
```

```

General remarks

Again, we see two boxes below the original text verses and their shorthand notation. The first box concerns observations at word level and the type-2 variant groups. In the second box, the combinations of the type-2 variants into potential type-2 variation formulas are presented. As a matter of fact, the first box is printed for the convenience of the audience, to show were the formulas of the second box come from. Later on, I will stop presenting the first box.

The process of splitting up words into single words or word parts

First, let us take a look at the first box with the 'Observations/type-2 variants' in it. Its first line reads:

```
02.0009 spli: *oversgone* (in 04-) in t. 04-05-12-13-14- --> *over sgone* (in
04-), based on t. 09-10-11-;6b
```

We see that sometimes in the original texts 'overschone' has been written as one word and sometimes as two words. Characteristic 6a tells us that differences in word boundaries are not text-genealogically important. (Of course, later on, when we will have developed a trustworthy genealogical tree with trustworthy tree building elements, we can evaluate the

text-genealogical power of a less convincing characteristic like 6a.) Therefore, we do not want to be hindered by these, for the moment, irrelevant differences in word boundaries. The solution is quite simple and practical. Roughly speaking, the computer looks if one word in a text version occurs as two separate words in another text version. If so, the computer will split up this single word, as dictated by the two separate words. In the example above, the computer detects that the shorthand word 'oversgone' of text 04 (this word also occurs in text versions 05, 12, 13 and 14) occurs as two separate words in texts 09, 10 and 11. Then the computer will split up this word in the shorthand texts of text versions 04, 05, 12, 13 and 14 into two words. Notice that the splitting of a word in one or more text versions into two or even more words is dictated by the occurrence of this word in other text versions. In other words, in the verses near verse number 02.9 example 'oversgone' has been split up; it is not necessary that the same word at another place in the text versions will be split as well.

The splitting up of a word into compartments is performed at the word level stage in which the type-2 variant groups are detected. It is not a clear type-2 variation formula, in which two type-2 variants are combined. However, it offers us information about characteristic 6b.

In the second box we first see that the splitting observation of the first box is more or less repeated. This repetition is necessary, because, later on, we will not use or print the information of the first box. If we would not repeat it, this information concerning characteristic 6b would get lost.

The combination of type-2 variant groups into potential type-2 variation formulas

Furthermore potential type-2 formulas are presented in the second box, using the five observed type-2 variant groups of the first box. All the combinations of the five observations are tested: the combinations of: 1. ob01 and ob02; 2. ob01 and ob03; 3. ob01 and ob04; 4. ob01 and ob05; 5. ob02 and ob03; 6. ob02 and ob04; 7. ob02 and ob05; 8. ob03 and ob04; 9. ob03 and ob05, and 10. ob04 and ob05.

The combinations 1, 2, 3, 6, 7 and 8 would create impossible type-2 formulas, because they deal with two variants which occur in both text groups. Take for example the second combination of ob01 and ob 03: 'ik' occurs in texts 01-02-04-05-09-10-11-12-13-14-, while '~sanderin' occurs in texts 01-14-. In this case a variation formula like 01-14|01-02-04-05-09-10-11-12-13-14- would be nonsense, since 01 and 14 are part of both opposing variant groups. Therefore, the computer knows that '~sanderin' and 'ik' are not competitive variants worth further investigation. Notice that the computer has placed a tilde '~' in front of the variants 'sanderin' and 'sandrin'; the tilde is used to denote that a variant is standing in the final (rhyming) position of a verse.

The testing of potentially good variation formulas against characteristics of good variants

The combinations 4 (ob01 versus ob05), 5 (ob02 versus ob03), 9 (ob03 versus ob05) and 10 (ob04 versus ob05) are potentially good combinations. These four combinations are presented to that part of the software which contains the 11 characteristics of text-genealogical variants.

The test of formula 4: rejected because of characteristic 7c and 4b

Combination 4 leads to the formula:

```
02.0009  13  ^comb.:  06-07-08-|01-02-04-05-09-10-11-12-13-14-="ig"|"ik"  (<:GD
g|k;7c) (^:W1=Pn; W2=Pn;4a+;4b-)
```

The final part of the formula will be clear: both 'ig' and 'ik' belong to the same word category Pronoun (= 4a+), but they are not substantives or verbs (= 4b-). This is reason

enough to reject the combination of both variants in one type-2 formula (= ^comb). Furthermore, the computer is taught to detect variants that are caused by the language difference or heavy dialects difference between the 'German' texts 06, 07 and 08 and the other 'Dutch' texts. In this case the computer detects that the difference between the 'German' 'ig' and the 'Dutch 'ik' is a rather small (= <) difference between the German and Dutch (= GD) languages/dialects. Characteristic 7c tells us that such a difference is genealogically unimportant. In other words, the software detects that 'ig' and 'ik' are variants of each other, but they are text-genealogically unimportant.

The test of formula 5: rejected because of characteristic 6a and 7d

Combination 5 results in:

```
02.0009 13 ^comb.: 01-14-|02-04-05-06-07-08-09-10-11-12-13-="~sanderin"|
"~sandrin" (<:e;?;6a) (wds r.p.;5) (^:names with > prox. 0.93;7d)
```

Several characteristics of text-genealogical variants can be applied. First, it is detected that the difference between both variants is rather small: it consists of a single vowel 'e'. Characteristic 6a tells us that a small orthographical difference between variants is trivial for text-genealogical purposes. However, since the difference is that small, we may conclude that both variants are competitive variants. The question, of course, is, whether we should consider a small difference like the mentioned 'e' as trivial. Later on, when we will have developed a trustworthy stemma of the *Lanseloet van Denemerken* text versions, we will try to find an answer to this question. For the moment, I, and therefore the computer as well, assume that this small difference is trivial indeed, although I have my doubts, as is expressed by the question mark in the formula. Second, the formula expresses that both words are in rhyming position, by which the word class both variants belong to is unimportant, as stated by characteristic 5. Third, the computer detects that both variants are names, which are very much alike. Characteristic 7d tells us that in this case, the variants are text-genealogically trivial.

The test of formulas 9 and 10: rejected because of characteristic 1

Combinations 9 and 10 lead to two formulas:

```
02.0009 05 ^comb.: 01-14-|06-07-08-="~sanderin"|"ig" (^:vp;1)
02.0009 11 ^comb.: 06-07-08-|04-05-09-10-11-12-13-14-="ig"|"over" (^:vp;1)
```

Both formulas are rejected as adequate type-2 variation formulas for the same reason: the variants do not belong to the same variation place, as requested by characteristic 1. How did the computer detect this? Let us consider '~sanderin' versus 'ig'. In text 01 '~sanderin' is the fifth word, seen from the left, and the first word, seen from the right. In text 06 'ig' is the second word from the left and the fourth word seen from the right. Therefore, both the left and the right positions of the variants differ. When only the left or right positions would have been equal, the software would have searched further. But now it is clear that it is very likely that both variants do not belong to the same variation place, by which the first characteristic of text-genealogical variants is offended. Therefore the variation formula can be rejected. Notice that the position of a variant is offered two 'chances': both its left position and its right position are considered. One could claim that the fact that '~sandrin' does have a tilde, while 'ig' does not, betrays that both variants are not at the same variation place. This view, from the right, may be correct. But it is possible that both variants, seen from the left, nevertheless, are occurring at the same variation place!

The detection of the fact that one variant has not been treated yet: characteristic 11a

Until now, only the rejected combinations 4 (ob01 versus ob05) and 5 (ob02 versus ob03) concern competitive variants. The type-2 variant group of ob04, concerning the variant 'over', is not found to stand across a competitive variant. In other words, this variant has not been treated by the software so far. Since there is no competitive (type-2) variant

available, possibly because ‘over’ is an added/omitted variant (as treated by characteristic 11a), the software will mention this as:

```
02.0009 13 ^treat: 4ch.wrd "over" (Pp) in 04-05-09-10-11-12-13-14- (rest:
01-02-06-07- 08-); 11a?
```

The question emerges of how the software was able to detect that a variant has not been treated. The software uses three rules for this goal. The first rule is that when in a certain potential variation formula is expressed that the difference between two variants is small (expressed by ‘<:’) or likely to be small (expressed by ‘?’) or that we are dealing with two variants that are both in rhyming position (expressed by ‘(wds r.p;5)’), both variants can be scratched off the list of type-2 variants. The second rule is that variants occurring in a potentially good variation formula (starting with ‘comb:’ and not with ‘^comb:’) can be scratched off the mentioned list as well. The third rule works when the word categories of both variants are known: when both categories are the same or when one of both categories is ‘Mx’, the computer judges that both variants can be scratched off the list as well. In our example above we have a list with five type-2 variants: ‘ik’, ‘~sandrin’, ‘~sanderin’, ‘over’ and ‘ig’. One variation formula expresses that the difference between ‘ig’ and ‘ik’ is small: ‘(<: GD g|k;7c)’. We see the small weight sign ‘<:’ in it. Therefore, the computer considers both variants to be covered or treated by that variation formula, and scratches them off the list of variants, which then will have only three type-2 variants left: ‘~sandrin’, ‘~sanderin’ and ‘over’. Another formula expresses that the difference between ‘~sandrin’ and ‘~sanderin’ is (likely) to be small, as stated by its element ‘(<:e;?;6a)’, which contains ‘<:’ and ‘?’. These are two reasons to remove ‘~sandrin’ and ‘~sanderin’ from the list of variants as well. The end result is that only ‘over’ remains on the list of type-2 variants. This variant is not treated in any formula to which one of the three rules can be applied. Therefore, only ‘over’ is presented in a ‘^treat’ formula. In this formula is expressed that variant ‘over’ is a word, consisting of four characters (‘4ch.wrd’, belonging to the word category of Prepositions (‘(Pp)’) and occurring in texts 04, 05, 09, 10, 11, 12, 13, 14 (‘04-05-09-10-11-12-13-14-’) and not occurring in the other texts (‘(rest: 01-02-06-07-08-)’); notice that text 03 is not mentioned in the enumeration of rest texts, because text 03 offers us no text here.

I repeat here that readers interested in the exact interpretation of the contents of the expressions in the second box, concerning variation formulas and other observations concerning the characteristics of text-genealogical variants, should consult Appendix B.

General remarks

Notice that in the box with the (potential) variation formulas a variation formula has been rejected (expressed by '^comb') three times because the variants belong to different variation places as covered by characteristic 1: '(^:vp;1)'.

The (re)detection of imperfect rhyme

In the box with Observations and type-2 variants a new element is presented, concerning the quality of the rhyme. It is observed, or better: re-observed, that both the rhyme of the pair (~beseten - ~verwissen) of texts 06 and 07 and the rhyme of the pair (~besessen - ~verwissen) of text 08 are not optimal. I say 're-observed', because this observation derives from the very first step of the very first part of the software ('Part 1: Create a Synoptic Text Edition of the *Lanseloet van Denemerken* Text Versions'), discussed at the start of this Appendix. There, we saw that during that very first step the rhyming pairs of the fourteen *Lanseloet van Denemerken* text versions are detected. In imperfect rhyming pairs special warning signs '#' are introduced. We saw, for instance, in the box with the title 'Step 1: rhyming pairs of text 06' a line like '06.11:(#beseten# - #verwissen#)'. Text 07 leads to more or less the same line: '07.11:(#beseten# - #verwissen#)'. Text 08 gives a slightly different result: '08.11:(#besessen# - #verwissen#)'. These three old observations are presented again in the box with Observations and type-2 variants above, in two 'new' observations:

```
02.0010 ob01: no pure rhyme in pair (~beseten - ~verwissen) of t. 06-07-
02.0010 ob02: no pure rhyme in pair (~besessen - ~verwissen) of t. 08-
```

The first observation ('ob01') informs us that the rhyme of the pair (~beseten - ~verwissen), occurring in texts 06 and 07 is imperfect, the second ('ob02') concerns the imperfect rhyme of the pair (~besessen - ~verwissen) of text 08. Because rhyming pairs occur in two verses, both observations go as well for the following verses near verse 02.11.

Characteristic 9/9a/9b tells us that good, text-genealogically informative variants must stand in an environment with 'perfect' rhyme. The thought behind it is as follows. When the rhyme is not perfect, a copyist may have felt the urge to emend the incorrect rhyming pair, often thinking that he was able to rebuild the original rhyming pairs. The text-genealogical danger will be clear: when another copyist felt the same urge, it is possible that he will build the same rhyming pair as his colleague. In other words, imperfect rhyming pairs may lead to parallelisms and are, therefore, text-genealogically dangerous.

In the box with the (potential) variation formulas both observations have been mentioned again, but now with some extra information:

```
02.0010 ?obs01: conventions pure rhyme violated in pair (~beseten - ~verwissen)
of texts 06-07- (near 02.10);T2?;9a
02.0010 ?obs02: conventions pure rhyme violated in pair (~besessen -
~verwissen) of text 08- (near 02.10);T1?;vowels;9a
```

The extra information concerns four elements.

The first element is '9a', refers, of course, to the fact that this variation falls under characteristic 9a.

The second extra element is 'vowels'. Sometimes, two words do not rhyme optimally, because their rhyming parts have different vowels. While discussing the detection of

characteristic 7b (see above, where the output near verse 02.8 is presented), we saw that, at least for the time being — that is to say that we have to evaluate these vowel matters later on —, differences in vowels between variants probably do not have text-genealogical significance. Analogously, when the violation of rhyme is caused by the fact that two vowels of both final words of a verse do not rhyme optimally, this does not seem to be of text-genealogical importance neither. The reason is simple: such violation can be corrected by other copyists. For instance, in the (German) pair ‘besessen - verwissen’ the rhyming parts ‘essen’ and ‘issen’ may have a good chance to survive in German copyists hands. But most Dutch or Flemish copyists will translate this German pair independently from each other into ‘beseten - verweten’ without any problem. In other words, such violation may easily cause parallelisms. Furthermore, I think that the simple judgement at the very first step of my software that ‘besessen’ and ‘verwissen’ do not rhyme optimally, denoted by the sign ‘#’, is rather rough, although serving properly the goal there of building a synoptic text. In my software ‘pure’ rhyme of two words is defined as an agreement in sound of the final vocal of these words followed, until the end of both words), by more or less the same sounding consonants in combination with potential schwas. According to my software, for instance, ‘beseten’ and ‘verweten’ rhyme: the final part of ‘beseten’ is ‘eten’ (the final vocal is the ‘e’, followed by the string of consonants and a schwa ‘ten’), while ‘verweten’ has the same final part. The final parts of ‘besessen’ en ‘verwissen’ differ: ‘essen’ versus ‘issen’. Therefore, one may simply claim, in accordance with the first step of my software, that both words do not rhyme. But is that judgement correct? I feel that ‘besessen’ and ‘verwissen’ somehow do rhyme, although the rhyme cannot be labelled as pure. Therefore, one may consider the element ‘vowels’ in the output rule ‘... T1?;vowels; 9a’ as a kind of warning and as a kind of qualification of the strong step 1 verdict that the words simply do not rhyme: the rhyme may not be pure, but since the rhyming violation consists of a difference in vowels, this violation may considered to be small and maybe irrelevant.

One could claim for the other pair ‘beseten - verwissen’, that these words can be easily converted by copyists into ‘beseten - verweten’, thus implying a danger of parallelism as well. At this point my software can be improved indeed. For the moment, it only detects rhyming violations concerning differences in vowels (etc.), not rhyming violations consisting of differences in vowels in combination with other small differences, in this case ‘e’ versus ‘i’ and ‘t’ versus ‘ss’. Remarkably, other cases (compare, for instance: ‘02.0040 04 ^comb.: 02-04-|06-07-="hert"|"hertse" (<:GD (t)s|t;fin-e;7c;7a)’), demonstrate that my software is able to detect such combined differences. Why did I did not improve my software at this point, which I consider to be a small ‘bug’ or error? I give three reasons. The first one is, that one must decide to stop the almost endless road of improving the software (at ad hoc points?) and start presenting the results. Else, the production of this dissertation would never have had been finished. The second reason is, that I think these kinds of differences can be analyzed in the future by morphological-syntactic parsers built by other scholars or me, which can deal with these historical medieval and renaissance ‘Dutch/German’ texts. The development of such computer grammars is work for years. Third, I repeat that in the end all the final observations or variations formulas, which the computer considers to be adequate, are presented to me as a philologist. Then I will take a look at the computer observations and formulas and check them as a philologist. Small errors will be detected by me, and, if necessary, evaluated. I admit that I would have felt more obligated to fix this bug when it would have led to a great number of inadequate formulas; the bug concerns only a few formulas. In other words, I know the limitations of my software, but I decided to stop improving it on small points in order to publish my dissertation.

The third extra element is ‘T1?’ or ‘T2?’. If the violation of rhyme occurs in, roughly

speaking, a single text, the variation occurs in a possible (the question mark expresses the doubts) ‘type 1’ or ‘T1’ environment; if two or more texts are involved, we have a ‘type 2’ or ‘T2’ environment.

The fourth element ‘(near 02.xx)’ expresses the verse number of the first rhyming word of the pair, in this case: ‘near 02.10’. This may seem to be redundant. However, in the verses near verse 02.11, this ‘near 02.10’ is repeated, by which we know that the first rhyming word belongs to 02.10 and the second word belongs to 02.11. We will come to speak about this matter when discussing the computer output concerning that (next) verse.

The test of the next formula: rejected, but with some small doubts

```
02.0010 12 ?comb.: 02-04-12-13-14-|01-05-06-07-09-10-11-="heb"|"hebbe" (<:2ch;
fin-e;7a;6a) (W1=Au;W2=Au;4a+;4b?;ok?)
```

In this formula is expressed that the difference between the two auxiliaries ‘heb’ and ‘hebbe’ consists of a difference in the double character ‘b’ and a final vowel ‘e’. I guess that this is a small difference as well, although I have some doubts, as is expressed by the question marks in the formula and by ‘ok?’.

The test of the next formula: rejected

```
02.0010 13 ^treat: 3ch.wrd "dus" (Av) in 01-02-04-05-07-09-10-11-12-13-14-
(rest: 06-08-) (T3 or T2?); (^:small word?);11a?
```

First, characteristic 11a tells us that we must be careful to use the absence or presence of small words as text-genealogically important. The difficulty is of course to define the notion ‘short word’. I told my software that a small (shorthand) word is a word with three or fewer characters. Second, we see that the rest group consists of two members, by which the computer knows that the type-2 group is possibly part of a type-3 (T3) variation formula, with three or more groups of which only one group is a type-2 group. As a principle, we only work with type-2 and not with type-3 variation formulas like 06-|08-|01-02-04-05-07-09-10-11-12-13-14-. Another possibility the computer will consider is that both texts 06 and 08 have an omission in the variation place with ‘dus’. This would lead to a kind of type-2 (T2) variation formula like ‘06-08-|01-02-04-05-07-09-10-11-12-13- 14-="-"|"dus"’. Because, coincidentally, text 06 has ‘dns’, caused by printing the character ‘u’ upside down, and text 08 has ‘alsus’, the suggestion of the type-3 formula turns out to be correct.

Repetition of already presented observations concerning rhyme:

02.0011 ?obs01: conventions pure rhyme violated in pair (~beseten - ~verwissen) of texts 06-07- (near 02.10);T2?;9a
02.0011 ?obs02: conventions pure rhyme violated in pair (~besessen - ~verwissen) of text 08- (near 02.10);T1?;vowels;9a

Both formulas have been presented in the box with formulas near the previous verse 02.10. They are repeated here, now of course with the new verse number 02.11, but still with the remark '(near 02.10)'.

Comments to one variation formula, rejected because of characteristic 9a:

02.0011 12 ^comb.: 06-07-08-|01-02-04-05-09-11-12-13-14-="~verwissen"|"~verweten" (wds r.p;5) (conventions pure rhyme violated;9a)

This formula expresses that the type-2 variants 'verwissen' and 'verweten' are standing in rhyming position, denoted by the use of '~'. However, the software immediately warns us: '(conventions pure rhyme violated;9a)'. The previous obs-formulas 01 and/or 02 have explained which words in which texts precisely cause this violation; in this case the word 'verwissen' in the only three 'German' texts 06, 07 and 08 does not rhyme optimally with the word 'beseten' or 'besessen' in the previous verses near 02.10. In other words, in this comb-formula is referred to both obs-formulas, where is explained how the conventions of pure rhyme have been violated.

From here on, only few comments on variants, formulas, etc. will be necessary.

The detection of differences in word order: characteristic 8

During the first step, expressed in the box with Observations/type-2 variants, the word order of the base text 02 is compared with the word orders of the other text versions. It is detected that the of the words ‘gelaten’ and ‘nit’ is different in text 01 versus all the other texts. This is a type-1 variation, with one text having one reading versus another reading in all the other texts. Furthermore, it is detected that the word ‘nit’ is an adverb. Characteristic 8 — remember that I am not convinced of the text-genealogical value of that characteristic; it will be evaluated later on — expresses that when one of the words in a different word order, the difference in word order is text-genealogically uninformative.

During the second step, expressed in the box with Variation formulas, this observation on word order in the first step is repeated. The reason for this repetition is, that later on we will only work with the Variation formulas box: if we would not repeat the observation on word order in the second step, it would be forgotten. Eventually, this leads to the formula, expressed in the box with Variation formulas:

```
02.0016 10 ^obs01: 01-|02-04-05-09-10-11-12-13-14-: W.O "gelaten"-"nit" (T1);8;
(^:W1or2=Av;8)
```

More information about the detection of differences in word order is to be found in the comments near verse 02.17.

The incompleteness of the search for differences in word order

Differences in word order can lead to a different place in a verse or line of variants. In other words, originally competitive variants can move to another variation place in a sentence, in which the variants are not competitive anymore, because they belong to different variation places, as characteristic 1 teaches. Therefore, it is possible that a difference in word order may cause that the computer oversees some interesting variants. For the time being, it is up to the philologist to check this. In the future, I can adapt my software on this point and teach the computer, for instance, that when it detects a difference in word order, it should not reject variants on the basis of characteristic 1.

Characteristic 1 variation formulas will not be presented anymore

From here on, I stop presenting the variation formulas concerning different variation placess (characteristic 1), because they take a lot of room and because, most of the time, they are evidently incorrect, useless and uninteresting variation formulas.

Another observation about differences in word order

Again we see that the computer detected a difference in word order in the variation formula:

```
02.0017 10 ^obs01: 02-04-05-09-10-|01-11-12-13-14-: W.O "spreken"-"altos"
(T2);8; (^:W1or2=Av;8)
```

is expressed that a difference in word order has been detected: in texts 02-04-05-09-10- the ‘spreken’ comes before ‘altos’, while in 01-11-12-13-14- ‘altos’ stands before ‘spreken’. However, the type-2 variation formula is rejected, because ‘altos’ is an adverb. Characteristic 8 tells us that when a difference in word order consists of a different placement of an adverb, the difference in word order is possibly parallelistic. Therefore, the type-2 variation formula is rejected.

I would like to repeat here that the current observations on differences in word order are limited: only the word order of base text 02 is compared with the word order of other texts. Suppose, for instance, that two non-base texts have two certain subsequent words ‘X’ and ‘Y’ and that word ‘X’ does not occur in the base text; suppose furthermore that two other non-base texts have the same words ‘X’ and ‘Y’, but now in a different word order. This difference in word order will not be detected by the software, because word ‘X’ is not present in the base text. Of course I could have decided to enhance the word order searching. However, this enhancement would make the software considerably slower and would consume a lot of computer memory. Furthermore, I still have my doubts on the text-genealogical value of differences in word order. Therefore, I decided to wait for the evaluation of the current limited word order observations. When the limited observations teach us that the text-genealogical value of differences in word order is small or worthless, it is not necessary to improve the word order searching facilities of the software. (As we will see later, differences in word order have no or small significance: therefore, the enhancement of the word order search facilities will not be necessary!)

```

The detection of inversion of (rhyming words of) verses (characteristic 10):

The variation formula

```
02.0020 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-: rhyming pair (~min
- ~sin) of text 02 (near 02.20) is inverted in text 01 (T1);10
```

shows that inversion of rhyming words of verses is detected as well. Just like the violation of pure rhyme, the inversion of verses is detected at a very early stage, when the rhyming pairs of several texts are compared with the rhyming pairs of text 02. In this case it is detected that the rhyming pair of text 01 differs from the one of text 02, as is expressed above, where step 2 and 3 of the first part of the software have been explained. There, in the box with the title ‘Step 3: combine rhyming pairs of texts 02 & 01’, we find the two rules: ‘*02.20:(mijn - fijn)’ and ‘01.56:(sijn - mijn) (*INV*)’. This information is presented again in observation ‘ob01’ in the upper part of the figure and in the current variation formula presented in the lower part of the figure. Since the inversion only appears in text 01, this is a type-1 variation ‘(T1)’. The detection of inversion of rhyming words deals with two verses. Therefore, the observation and the variation formula are presented again in the next figure, dealing with the verses near 02.21.

The variation formula

```
02.0022 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-: 01- has NO TEXT
(T1);11b
```

shows that the omission of verses is detected as well. I say omission, because the text versions are compared with base text 02, in which a verse is present. The omission of verses is detected at a very early stage, while building the synoptic text (see above, at the beginning of this Appendix, where Step 2 + 3 are discussed and the notions ‘n.o.’ and ‘@’ are explained.

Verses near 02.23 to 02.48 (without comments)

To save space these verses can be viewed in Appendix C (on the cd-rom)

APPENDIX B: Guide to the Interpretation of the Computer Results and Output

TABLE OF CONTENTS OF APPENDIX B

I. Information about the Fourteen *Lanseloet van Denemerken* Text Versions: Text Codes or Sigla

II. Information about the Diplomatic Transcription of the *Lanseloet van Denemerken* Text Versions and the Shorthand Text Developed by the Computer from it

II.a The Diplomatic Transcription
II.b The Shorthand Version of the Diplomatic Synoptic Text, Generated by the Computer

III. Information about the Computer Generated Formulas Expressing (Non-)Genealogical Relations between the *Lanseloet van Denemerken* Text Versions: A. 'Comb-Formulas'; B. 'Obs-Formulas'

III.a The Eight Components of the 'Comb'-Formula, concerning Characteristics 1, 4, 5, 6 and 7, Presented from the Left to the Right in the Formula
III.a.1 The first four components: 'verse-id', 'amount of texts', 'comb.' and variants
III.a.2 The fifth component, concerning **characteristic 1**
III.a.3 The sixth component, concerning **characteristics 6 and/or 7**
III.a.4 The seventh component, concerning **characteristic 4**
III.a.5 The eighth component, concerning **characteristic 5** (possibly in combination with **characteristic 9**)

III.b Four Types of the 'Obs'-Formula, Concerning Characteristics 8, 9, 10 and 11
III.b.1 The first type of the obs-formula, concerning **characteristic 8** on word order
III.b.2 The second type of the obs-formula (in combination with the comb-formula), concerning **characteristic 9a and 9b** on obeying rhyming conventions
III.b.3 The third type of the obs-formula, concerning **characteristic 10** on inversion of verses
III.b.4 The fourth type of the obs-formula, concerning characteristic 11
III.b.4.1 Information concerning **characteristic 11a**
III.b.4.2 Information concerning **characteristic 11b**

I. INFORMATION ABOUT THE FOURTEEN *LANSELOET VAN DENEMERKEN* TEXT VERSIONS: TEXT CODES OR SIGLA

This information has moved to §4.2 of this dissertation.

II. INFORMATION ABOUT THE DIPLOMATIC TRANSCRIPTION OF THE *LANSELOET VAN DENEMERKEN* TEXT VERSIONS AND THE SHORTHAND TEXT DEVELOPED BY THE COMPUTER FROM IT

II.a THE DIPLOMATIC TRANSCRIPTION

Generally, all the text versions of *Lanseloet van Denemerken*, have been transcribed **as diplomatically as possible**, which implies, roughly speaking, that each character in an old edition is represented by the current, modern character. The aim of my diplomatic edition is to give its user a good picture of the (original) contents of the fourteen *Lanseloet van Denemerken* texts. I developed software, described in the first part of Appendix A, to build from the fourteen diplomatic transcriptions one synoptic text in which each verse of text G/L is accompanied by the corresponding verses of the thirteen other (diplomatic) texts.

Transcribing a text diplomatically is not as simple as it may look like at first sight. As the (diplomatic) editor I had to make several decisions:

a. In **old character sets** modern characters are sometimes represented by **two** (or even more) **forms**, like for instance the ‘s’, which could be represented by a long s and a round s. In other words, the relationship between old and current, modern, character sets is not a 1:1 relationship. When a modern character has two or more forms in the old texts, I simply decided to transcribe the character into its current, modern, single form.
b. On the other hand we see that old character sets have **ambiguous characters**, in the sense that one old character can be represented by two different modern characters. The old character ‘u’ can be interpreted as an ‘u’ or as a ‘v’. The same goes for the old character ‘v’, which is a modern ‘u’ or ‘v’. Often editors decide to transcribe an old ‘u’ (or ‘v’) as a modern ‘u’ or a ‘v’. By doing so, they hope that the audience will read and understand the the text more easily. I decided to transcribe a ‘u’ in the old texts as an ‘u’, also when we should interpret this character as a ‘v’. I also transcribe an old ‘v’ as a ‘v’. The same goes for other characters. The transcription rule I used is: I transcribe old characters u, v, i, j, uu, w, y and ij as they occur in the text as the modern characters u, v, i, j, uu, w, y and ij. I realize that other solutions are possible as well, and I hope that the readers/users of my transcription are smart enough to see that for instance a (modern) character ‘u’ in my text edition sometimes must be interpreted as a ‘v’. Later on, when we will discuss the automated production of a shorthand version of the synoptic diplomatic text, we will see that in the shorthand text a ‘u’ is changed into a ‘v’ when the ‘u’ has to be interpreted as such; a ‘v’ is transformed in the shorthand text into a ‘u’ when the ‘v’ is a vowel.
c. Often, **several character types in several sizes** have been used in the old manuscripts and imprints: Gothic, Roman (etc.) types. In the edition of the texts I only used one non-proportional type of one size.
d. In the original texts line or verse numbers are not included. I let the computer add a **line number** at the beginning of each line. This line number starts with the two digits text code, followed by a point, followed by a number (that is raised with ‘1’ for each new line). By doing so, each line of a text version has a unique line number. (I say ‘line number’ and not ‘verse number’, because verse numbers only refer to verses and not to clause headers. Text 02, for instance, has 927 verses (the last two lines with the impressum of Govert van Ghemen are considered to be verses as well), while it has 1013 lines.) One could argue now, that I should have had surrounded these computer generated line numbers with the signs ‘[]’ (as explained below), to draw attention to the fact that these numbers do not occur in the original texts. However, it is so evident that these numbers are artificial and have been added, that I considered the ‘[]’ to be redundant and superfluous.
e. Sometimes editors of diplomatic text versions decide to correct evident errors in the texts. The problem with this choice is, that sometimes it is difficult to decide whether something is an evident error. I **did not correct (evident) errors**, but present them as they are. In their diplomatic edition of text 01 (or H/BR) Roemans & van Assche (1982) decided, for instance, to change the word ‘moerder’ (murderer) into ‘moeder’ (mother), as they mention in a footnote. It is likely indeed that we must read ‘moeder’ instead of ‘moerder’. But I think it would have been better to give in the text ‘moerder’ and that in a note would have been said: ‘Read: moeder’. In my edition I simply transcribed ‘moerder’ as ‘moerder’. Another example of evident errors is the fact that in the printed *Lanseloet* texts often the character ‘n’ has been printed incorrectly. This character has often turned 180 degrees, by which it became a ‘u’ (and vice versa). I did not correct these evident errors neither.
f. The original text versions often have a ‘**custos**’ or ‘catchword’ at the bottom line of a page, outside of the text. This custos shows the first character(s) of the first word(s) of the next

page. Sometimes the signature (or folio number) has been printed next to the custos. These remarks have no meaning for the reader, but were placed there, after the text had been prepared, to ease the process of book production. Since a custos has no meaning for the reader, I did not transcribe it: it is absent in the text edition.

g. **Clause headers**, mentioning the name of the person that will speak out the following verses, are offered by me at a new line, with an indention of five positions/characters. Usually, the clause headers are presented in the *Lanseloet* texts at the centre of a new line (in texts 01, 02, 03, 06, 07, 08, 11, 12 and 13.) In texts 11, 12 and 13 the clause headers have been printed with Roman types, while the other parts of these texts have been printed with Gothic types. Generally, in the original *Lanseloet* texts 04, 05, 09, 10 a clause header is offered in the right margin of a verse, preceding the first line of the new clause. That first verse of a new clause in texts 04 and 05 is preceded by a paragraph sign (denoted by me with the sign '@'). In text 09 the first verse of the new clause indents. In text 10 the first verse of a new clause has not been marked by indention or a paragraph sign.

   I have used clause headers (and the accompanying clauses) as the building stones in the automated process of developing a synoptic edition of the fourteen *Lanseloet* texts. Of course, it was easy to teach the computer to recognize the clause headers, with their indention. Unfortunately, in some *Lanseloet* texts some clause headers have been left out. In case a clause header was evidently missing, I inserted it into the text, surrounded and clearly marked by left and right brackets '[]'. It is remarkable that in text 05 (or A/M) many clause headers are missing (but added by me, between brackets), while the other texts do have clause headers there: 05.72 (near 02.72), 05.535 (near 02.527), 05.592 (near 02.584) and 05.776 (near 02.766). Furthermore, the clause headers in 01.8 (near 02.7), 10.171 (near 02.165), 09.189 (near 02.190), 01.359 (near 02.331) and 01.982 (near 02.955) are missing and added by me. (In retrospect I think that it was not strictly necessary to add the clause header in 01.8.) In two cases clause headers are absent in more than one original text: near 02.279 in (added) verses 04.157, 05.284, 09.282, 10.289, 11.292, 12.290, 13.290 and near 02.380 in 05.388 and 09.384. As explained in the theoretical part of my dissertation, the absence of clause headers is text-genealogically not important, because missing clause headers can be reconstructed rather easily by copyists.

h. Text 14 (or S/BO) is the **'s-Gravenpolder** manuscript, consisting of two roles with the texts of Lanseloet and Sandrijn. Schaars and Hüsken (mentioned above) offer a diplomatic edition of these roles: first, the complete text of the *Lanseloet* clauses is offered, then the text of the Sandrijn clauses follows. I present the role texts differently, because my aim was to produce a synoptic diplomatic edition of the *Lanseloet* text versions: a diplomatic edition in which corresponding verses of the *Lanseloet* texts are printed together, verse by verse. Schaars and Hüsken offer (own) verse numbers, which I did not use in my edition. Happily, they give at the beginning of a clause also the corresponding verse number of text 01 (or H/BR), as presented by Roemans & van Assche (1982). Since I offer the Roemans & van Assche (1982) verse numbers as well, my edition can be easily compared with the edition of Schaars and Hüsken.

   Both role texts have no clause headers, except at the very start of the role. The absence of clause headers is logical, since every clause of a role text had to be spoken by one and the same person. In other words, the clause header is offered implicitly in the roles. In my synoptic edition, these implicit clause headers have been included, surrounded by the signs '[]'. Instead of a clause header the last word of the clause before, is presented in the roles. Therefore, the roles offer in fact a bit more than the texts of Lanseloet or Sandrijn only. Such word, offering the last word of the previous speaker, is

called a **custos**. I decided to print these 'custodes' of the 's-Gravenpolder text in the synoptic text, because they offer information about the text of the previous player. This custos is preceded by the notation 'cust.' and placed between brackets '[]'.

i. It must have become clear by now, that I **avoided** as much as possible to **add information** in my edition of the texts, when this information is not available in the original texts. This implies that I did not add extra **punctuation**, nor did I change small characters into **capital characters**. When an original *Lanseloet* text starts with a **new line** or verse, the text in my edition starts with a new line or verse as well. **Paragraph signs** have been transcribed as '@'.

j. Despite of this principle it was necessary to add here and there some information in the transcribed text. This **(extra) information** is easy recognizable, because it is always between brackets **()**, **[]** or <>. Often this information is already available in the texts (and therefore it is not truly 'extra' information), but in another way we are acquainted with. For instance, the contemporary readers of the *Lanseloet* texts will often not have had any difficulties in resolving well-known abbreviations, while many modern readers, not acquainted with the old abbreviations, will. So when I resolve an abbreviation, I do not add extra information, but I reveal information that is already present in the text.

() = Resolved abbreviation(s):

In the manuscripts and imprints of the *Lanseloet van Denemerken* versions the copyist and printers have often used abbreviations, signs that indicate that at the place they occur (or in their direct neighbourhood) one or more characters have been left out (and should be filled in by the reader). I decided to resolve these abbreviations; the resolved characters are put between round brackets ().

Example: 01.1038 Sprect houeschelike en(de) mint m(et) t(ro)uwe(n) [948]

Comment: in the line or verse with the artificial line number 01.1038 (occurring in text 01 or H/BR) the abbreviation signs for resp. 'de', 'et', 'ro' and 'n' have been resolved by me.

Often the final d of the conjunction 'und' in the German texts has been abbreviated. The solution of this abbreviation is simple, since the plain 'und' is very often used in the German texts; verse 07.281 is the only verse that reads 'unde' instead of 'und'.

[] = Added by me, B. Salemans:

- In texts 01 (H/BR) en 02 (G/L) I have added at the right part of each verse and clause header between right brackets the **verse number** of 'standard' editions of these texts (for H/BR I used the edition of Roemans & van Assche (1982), mentioned above; for G/L I used the only available edition from 1837 (!): Hoffmann von Fallersleben, Lantsloot ende die scone Sandrijn, in: Horae Belgicae. Studio atque opera Henrici Hoffmann Fallerslebensis, Pars quinta (pp. 1-44), Vratislaviae, apud Georgium Philippum Aderholz, 1837 (anastatic print in 1968: Amsterdam, Editions Rodopi).

  Examples: 01.15 Die een vrouwe es bouen al [7]

  Comment: this verse with the computer generated line number 01.15, the fifteenth rule of text 01 (or H/BR) can be found in the Roemans & van Assche (1982) edition as the verse with the verse number 7.

- When a text line starts at a new page, I added the **signature** (or folio number) of that page at the right of that line. (The indication of the start of a new page can be of importance for text-genealogical research; when a book was put into a new cover or binding, the bookbinder had to cut the book block; this could result in the loss of upper and bottom lines and characters in the left and right margins; however, a copyist could have copied the text before it lost lines and characters;

logically, when a *Lanseloet* text in its current shape is studied, we must be very careful in drawing conclusions when e.g. the first verse of a page is missing.) Often a page does not have signature, because, originally, it was only printed for the bookbinder's sake and not for the reader of the book. A verso of a page, for instance, does not have a folio number. When a (new) page does not show a folio number, I surrounded the (artificial) folio number with the signs '-'. Sometimes a question mark has been added as well. In that case I was not absolutely sure, whether the folio number is correct.

- As has been mentioned above, sometimes a text has no **clause header**, where other texts do. A clause header that has been added by me is surrounded by brackets '[]'.
- The '**custodes**' of the roles of Lanseloet and Sandrijn in manuscript S/BO are placed between brackets as well, as we discussed above.
- I have also mentioned the occurrence of **woodcuts** between '[]'.

<> = (only occurring in text A/BR:) partly added by B. Salemans

On many pages of the fragmented text A/BR words or parts of words have disappeared due to holes in the pages or completely missing pages. However, the printer Adriaen van Berghen used a lot of (thick) ink of possibly poor quality: often we can see the characters of the opposite page in mirror image. (Apparently the folded sheets - or gatherings - had not enough time to dry.) Furthermore, at the end of A/BR an extra part of one or two other A/BR-texts (most likely from the same edition) are presented. The parts concern C1r (more or less visible verses: 04.196, 04.202-04.210), C1v (more or less visible verses: 04.227-04.253), C2r (more or less visible verses: 04.259-04.285), C2v (more or less visible verses: 04.293-04.310), C5r (04.327-04.353), C5v (04.360-04.383), C6r (04.390-04.408), C6v (upper part of the mark of Adriaen van Berghen)

Therefore, a lot of lost characters can be reconstructed. These reconstructed characters are printed between brackets '<>'. Notice that I checked out that in the ultimate variants for the development of the *Lanseloet* tree none of these reconstructed readings is used.

Example: 04.45 <O s>andrijne wel schone wijf

k. Often it is difficult to see whether a **quote** ' is preceded or followed by a blank character or not. When a quote is at the end of a word, I added a blank after the quote. When it is at the beginning, I added a blank character before it.

l. In the fragmented texts G/DH (03) and A/BR (04) I added, between '[]', some **directions**, to fasten the automated process of glueing the separate texts into a single synoptic text. Of course, in the automated process of detecting (type-2) variants these directions are not considered as verses of the original texts. Furthermore, I have told the computer sometimes which lines of the texts are considered to be **prose text**. Generally, in the synoptic text, one verse of the base text G/L (02) is presented, accompanied by the corresponding verses of the other texts. When prose text consist of two or more lines, these lines are printed together, and not split up line by line.

For example, near verse 02.277, text 07 (K/G) has the accompanying verse 07.278. This verse is followed by four prose lines, which all together are printed in the synoptic text directly after/under verse 07.278:

07.278 Vnd verbeiden vp die camer myn
07.279 Tzo dat yr my bre(n)get die schone sandrin
07.280 @ Hier na volget hoe die moder van
07.281 die edele here lansloot vnde tzo dye schone
07.282 sandrine ginch vnd verrede yr.

m. When texts are compared with the base text G/L (or 02) by the computer, it is able to detect **absent verses**. There are two types of absent verses, as will be explained now. In the synoptic text absent verses are notated in two ways: 1. the text number followed by '=>*', and 2. the text number followed by '=>@'. The star notation, like '03=>*', means that the text 03 (the fragmented text G/DH) has not been delivered, because pages are absent in this text or because the text has already reached its last verse. In other words, generally, the '*' points to a hole in the text or text that has been lost, not because a copyist made an error, or so, but due to the ravages of time. The '@' notation, like '01=>@' (near, for instance verse 02.22), means that text 01 has no verse here, due to a copyist or printer. (Of course, it is also possible that the absence of verse(s) in text 01 is original, and that text 02 (G/L) has unoriginal, extra verses.) '@'-verses have not been caused by the ravages of time. See also Appendix A, the remarks on 'n.o.' and '@'.

n. Most of the time, each verse of a text version is printed in a single rule in that old text version. In my transcription I used **for each verse a separate line** as well. Sometimes, especially in about 15 places in the two-column texts 12 and 13 (together about 30 places), the final (parts of) word(s) of a long verse are printed on a second rule. See for example rule 12.186 (or 13.186): the original text looks like:

Al soude ikse met mijn tanden verscheu=
ren

which I copied as:

Al soude ikse met mijn tanden verscheuren

I transcribed such 'broken' verses as if they had been printed on a single rule. The practical reason to do so, was that my software expects that a (non-prose) rule ends with a word in rhyming position.

On the other hand, the German texts contain at the end rules which contain more than one verse, probably because the/a printer noticed a lack of printing space. The verses at the end of text 06, near the Conclusie, look like:

Nu neemt hier exempel an Soe wie dat mit
trowen mynt Als he syn lief te wille vint

I transcribed these verses on three rules (numbered: 06.1003, 06.1004 and 06.1005). The situation is the same in text 07:

Nu neemt hier exempel va(n) Soe wie dat mit
trouwe(n) mint Als he syn liefde vynt

and in text 08:

Nu nemt hier exempel van So we dat mit
trouwen mint Als he syn lieffde vynt.

Both rules of text 07 and of text 08 were transcribed by me as three rules (resp. 07.1002, 07.1003, 07.1004 and 08.1000, 08.1001, 08.1002).

II.b THE SHORTHAND VERSION OF THE DIPLOMATIC SYNOPTIC TEXT, GENERATED BY THE COMPUTER

Once the diplomatic synoptic text has been prepared we could order the computer to search for (type-2) variants. Because the texts, created during the period from about 1400 to about 1700, have been written of printed with different orthographical systems, the same words can show up in several forms. These differences are trivial from a text genealogical point of view. (Later on, when we will have established the genealogical tree of the fourteen *Lanseloet van*

Denemerken text versions, we can evaluate whether these differences are trivial indeed.) When we get rid of these differences, by simplifying the spelling of the texts, we - or better: the computer - will be able to find more accurately the type-2 variants.

The simplification of the spelling leads to a shorthand version of the texts. Of course it is not claimed that the shorthand version is the phonetic representation of the texts. I, or better: the computer, uses many rules for generating the shorthand version from the diplomatic synoptic version. The main rules are:

a. When two or more vowel signs (‘a’, ‘e’, ‘i’, ‘o’, ‘u’, ‘y’) stand next to each other, this string of vowels is changed into one vowel sign. For example, ‘oe’ or ‘oi’ in the synoptic text is translated into a simple ‘o’ in the shorthand text. There is one exception to this rule: the combination of vowels ‘ou’ and ‘au’ are represented in the shorthand text as ‘aw’.
b. The spelling of character combinations like ‘gh’, ‘sch’ and ‘ck’, is simplified into ‘g’, ‘sg’ and ‘k’. A ‘q’ in the original texts is represented in the shorthand text as ‘kw’.
c. A ‘u’ is changed into a ‘v’ when the ‘u’ has to be interpreted as such; a ‘v’ is transformed into a ‘u’ when it is a vowel; sometimes ad hoc rules have been used for this transformation.
d. When a word ends with more or less the same characters, they are simplified: e.g. ‘dt’ becomes ‘t’.
e. The brackets ‘()’, ‘[]’ and ‘<>’ of the synoptic text are not present in the shorthand text. Folio numbers, verse numbers and remarks about occurring woodcuts between brackets ‘[]’ have been removed in the shorthand text.
f. In the shorthand text capital characters have been transformed into small characters; punctuation is not available in the shorthand text.

An example:

The synoptic text has the following verses:

02.173 Ic moetse minnen wat mijns ghesciet [154]
01.216 Icx moetse mi(n)ne(n) wat ghesciet [195]
05.174 Ick moetse minnen wat mi gesciet
06.175 Ich moetse leif haen wat myns gheschiet
07.175 Ich moet sie lief hain wat myns geschiet
08.175 Ich moisz sy lieff hain wat myns geschiet.
09.172 Ic moetse Minnen wat mijns geschiet/
10.179 Ic moetse minnen wat mijns geschiet.
11.181 Ick moetse minnen wat mijns geschiet.
12.180 Ick moetse minnen wat mijns geschiet.
13.180 Ick moetse minnen wat mijns geschiet.
03=>*
04=>*
14.159 ick moetse minnen wat mij geschiet

In the shorthand text, these verses are represented by:

02.173 ik mot se minnen wat mins gesgit
01.216 iks mot se minnen wat gesgit
05.174 ik mot se minnen wat mi gesgit
06.175 ig mot se lif han wat mins gesgit
07.175 ig mot si lif han wat mins gesgit
08.175 ig mos si lif han wat mins gesgit
09.172 ik mot se minnen wat mins gesgit
10.179 ik mot se minnen wat mins gesgit
11.181 ik mot se minnen wat mins gesgit
12.180 ik mot se minnen wat mins gesgit
13.180 ik mot se minnen wat mins gesgit
03*
04*
14.159 ik mot se minnen wat mi gesgit

Notice that if the synoptic diplomatic text would not have been transformed into a shorthand version, the computer would not have been able to detect 'lif' as a type-2 variant.

g. When one word (considered to be a string of characters between two blank characters or spaces) in a verse of one or more texts is printed as two or more words in one or more other verses, the computer will split up this word into two or more words. In the example above, the computer detects that the two words 'mot si' of text 07 are printed as one word ('motse' or 'motsi') in the ten texts 01, 02, 05, 06, 09, 10, 11, 12, 13 and 14. In this case the computer decides to split up that word in the ten texts. The reason to do so is that characteristic 6 tells us that differences in word boundaries are of no text-genealogical value. (Of course, this characteristic will be evaluated later on as well.) Notice well that a word is split into two or more other words only when this word is split in another text at (more or less) the same variation place. In other words, when the computer splits up the word 'motse' into 'mot se', it is not necessary that the computer splits up the same word 'motse' in a verse some lines further or before. For example: the word 'ist' in the verses near verse 02.50 has been split into 'is t', while the word remains unsplit in the verses near verse 02.56; [ad hoc: I prohibited the computer to split 'oft' near 02.523]. To put it differently: the computer takes a look at all the fourteen verses that are printed in the synoptic edition near one verse 'x' of base text G/L; when a certain word of one or more verses exists as two or more words in one or more other verses this word will be split. The accompanying verses dictate whether a word in a verse must be split. For more information about the splitting up of words in the short-hand texts I refer to Appendix A, 'The process of splitting up words into single words or word parts'.

III. INFORMATION ABOUT THE COMPUTER GENERATED FORMULAS EXPRESSING (NON-)GENEALOGICAL RELATIONS BETWEEN THE *LANSELOET VAN DENEMERKEN* TEXT VERSIONS: A. 'COMB-FORMULAS'; B. 'OBS-FORMULAS'

On the basis of the 1012 text verses (of bases text 'G/L' or '02) the computer detected:

- 6632 type-2 variants: variants that occur in two or more text versions (observations on differences in word order, on interpolated and disappeared verses and inverted verses are not included in this number of variants).

- 5157 type-2 variation formulas that violate characteristic 1, which states that genealogical variants must stand at the same variation place. Characteristic 2, stating that only type-2 variants or variation formulas are worthwhile for further investigation, filters out many formulas before characteristic 1 will be tested; else the number of 5157 would have been much larger.
- 5758 variation formulas that do not violate characteristic 1.

There are **two kinds of variation formulas**: the '**comb-formula**' and the '**obs-formula**'. In a comb-formula we can find the (type-2) '**comb**'-ination of two variants in a genealogical formula. The way comb-formulas should be read or interpreted is explained in III.a below. In an obs-formula '**obs**'-ervations are expressed that deal with variations beyond single word level: word order within the verses, inversion of verses, addition (= interpolation) or deletion of words or verses. I consider the '^treat-formula' to be a special case of the obs-formula. The way obs-formulas should be read or interpreted is explained in III.b below.

Both types of variation formulas cover nearly all the characteristics of text-genealogical variants. However, they do not offer any information about characteristic 2 and 3. **Characteristic 2** expresses that text-genealogical variants must be part of a type-2 variation, which implies that two different groups of text versions (each group must have two or more text groups as members) have precisely two different variants. I have ordered my software to trace only type-2 variations. Therefore, all the detected variation formulas are (potential) type-2 variations. **Characteristic 3** states that text-genealogical variants must be grammatically adequate and must be positioned in a grammatical correct context. My software is word-oriented and lacks a syntactic parser. In other words, characteristic 3 has not been automated. Therefore, it is up to the philologist to decide whether a detected variation formula concerns two variants that are positioned in a grammatically correct context. (Another attractive option is to assume that the texts are grammatically okay.) The absence of a syntactic parser seems to be a severe shortcoming. However, this shortcoming must be put into perspective. Most of the time, a syntactic parser will give more than one analysis of a syntactic structure of a sentence. Therefore, when a ('diachronic') parser would have had been available to analyze the Dutch language/dialects from about 1400 to 1700, the interference or decisions of the philologist concerning the ambiguous possibilities would have been inevitable as well. Of course I am familiar with the existence of probabilistic parsers that can give one analysis of a sentence. Excellent probabilistic parsers can analyze sentences with an accuracy of 95 %. This 'gambling' approach implies that 1 out of 20 sentences will be analyzed incorrectly! Furthermore, I am convinced that the syntactic laws of 'normal' sentences can sometimes be (slightly) overruled in rhyming verses (caused, for instance, by rhyming and rhythm conventions), while these verses are still acceptable for the reader or the audience. In other words, the detection of a non-grammatical sequence in a verse by a syntactic parser can be put into perspective as well. Finally, I think I can say, having read the texts of *Lanseloet van Denemerken* several times, that - in general - these texts show no ungrammatical verses. I am convinced that the accuracy of the previous statement is higher than 99 %. In other words, as far as characteristic 3 in combination with the *Lanseloet van Denemerken* text is concerned, I actually do not really miss a syntactic parser. (Admittedly, I can only say that after having analyzed/read these texts.) Therefore, we may indeed assume that all the text versions are syntactically adequate. This implies that we can put characteristic 3 out of order for the *Lanseloet van Denemerken* text versions. Of course this does not imply that characteristic 3 is useless for text-genealogical research. But in case of the *Lanseloet van Denemerken* text version we can put it aside.

Keep in mind that in variation formulas no information is offered on the 'originality' of one of the variants.

III.a THE EIGHT COMPONENTS OF THE 'COMB'-FORMULA, CONCERNING CHARACTERISTICS 1, 4, 5, 6 AND 7, PRESENTED FROM THE LEFT TO THE RIGHT IN THE FORMULA

The comb-formula has the following components, of which the first four are always present:

1. (always present:) the **verse-id** or verse number of the base text (text 02)
2. (always present:) the **amount of texts** concerned; of some texts we have only fragments; we have only one page of text 03; as a result, the maximum amount of texts is 13
3. (always present:) **comb.** or ^comb. or ?comb. followed by
4. (always present:) **Prt1 '|' Prt2 '=' W1 '|' W2**
5. (not always present:) information concerning characteristic **1**
6. (not always present:) information concerning characteristics **6** and/or **7**
7. (not always present:) information concerning characteristic **4**
8. (not always present:) information concerning characteristic **5** (possibly in combination with characteristic **9**)

I repeat that characteristics **8** to **11** are treated by the obs-formula (see III.b) and that characteristic 3 has not been automated yet. (Admittedly, characteristic 9 plays also a role in the application/test of characteristic 5.)

III.a.1 The first four components: 'verse-id', 'amount of texts', 'comb.' and variants

1. Every formula starts with the number of the verse or rule of the base text. Since every verse has an unique verse number, it is easy to find the text source of the formula.
2. The verse-id is followed by a number which tells us how many text versions are involved in the formula.
3. After the verse-id 'comb.' is printed. 'comb.' is the shorthand for combination, which means that in the formula two (type-2) variants have been combined into one (type-2) variation formula. Possibly a '^' or '?' at the start is included: '^comb.', with the not-sign '^', implies that the computer rejects the combination of variants as a good, text-genealogical combination, because one or more characteristics of text-genealogical variants has been violated, as is explained later on in the formula; '?comb.' means that the computer or my theory has doubts whether the combination of variants is text-genealogically informative; when 'comb.' has no '^' or '?' at the beginning, this means that according to the computer the combination-formula is potentially text-genealogical; of course, the philologist must decide whether this is correct.
4. After 'comb.' we find a first set ('part 1' or 'prt1') of two or more text codes, followed by the 'versus'-sign '|', followed by a second set ('part 2' or 'prt2') of two or more text codes, followed by the equal-sign '=', followed by the first variant ('word 1' or 'W1'), followed by '|', followed by the second variant ('word 2' or 'W2'). I followed the convention of Dearing (see V.A. Dearing, Principles and Practice of Textual Analysis, University of California Press, Berkeley - Los Angeles - London, 1974 (ISBN 0 520 02430 3), p. 57), to write in the type-2 variation formula the smaller group with text codes before the larger group. Within a group the text codes are arranged in rising order. The first variant occurs in the texts mentioned in the first set of text codes. The second

variant occurs in the texts mentioned in the second set. The variants are in rewritten, simplified shorthand form, i.e. not in the original form as to found in the original texts.

Two extra remarks on the form of a variant in a formula:

- when a variant starts with a '~', this sign denotes that the variant stands in rhyming position (i.e. the last word of a verse);
- sometimes a variant (like a short word like 'so') occurs twice in a verse; logically, when in a variation formula with such a word, it is not clear to which of both words the formula refers; therefore, the computer adds a '2' at the end of the second word. In a variation formula like

  02.0052 13 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-="tso2"|"gi" (^:vp;1)

  is expressed that the second 'tso' in the Cologne texts 06, 07 and 08 and 'gi' in the other texts occur at different variation places.

In the variation formula:

02.0443 12 comb.: 01-02-05-06-07-08-|09-10-11-12-13-14-="verdolt"|"gerist"

- '02.0443' is the verse-id;
- '12' is the number of the texts involved (the texts involved are 01, 02, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14: together 12 texts);
- ' comb.' denotes that the computer or the theory says that the combination of variants leads to a potentially good (type-2) variation formula;
- the variant 'verdolt' can be found in texts 01, 02, 05, 06, 07 and 08;
- the variant 'minne' can be found in texts 09, 10, 11, 12, 13 and 14.

Another example; in the variation formula:

02.0010 12 ?comb.: 02-04-12-13-14-|01-05-06-07-09-10-11-="heb"|"hebbe" (<:2ch;fin-e;7a;6a) (W1=Au;W2=Au;4a+;4b?;ok?)

- '02.0010' is the verse-id;
- '12' is the number of texts involved;
- '?comb.' denotes that the theory, and therefore the computer as well, does not know whether the combination of the variants 'heb' and 'hebbe' in resp. texts 02, 04, 12, 13 and 14 and texts 01, 05, 06, 07, 09, 10 and 11 leads to a good genealogical variation (formula). The computer detects that both 'heb' and 'hebbe' are auxiliaries or frequently used verbs. At the moment I was developing the theory I had my doubts about the text-genealogical significance of this kind of variants. Later on, when the chain or stemma of the *Lanseloet van Denemerken* text versions will have been developed, we will be able to evaluate whether the '?comb.'-formulas, like the one above, are in accordance with this tree and draw conclusions about their text-genealogical value.

III.a.2 The fifth component, concerning characteristic 1

Characteristic 1 expresses that text-genealogical variants must occur in the same variation place. All the characteristic 1 variation formulas are presented in Appendix D. In the Outline of Appendix D only the characteristic 1 formulas are presented concerning the first 19 verses of the *Lanseloet* texts. How does the software determine whether two variants are in the same variation place? Suppose we have a potential variation formula '01-02-03-|11-12-13-="leven"|"bos"'. First the software determines the position of the first variant in the first text of the type-2 group. In this case, it determines the position of 'leven' in text 01. Suppose that text 01 has eight words, and that 'leven' is the fifth word. Then the left position (or l.pos) of

'leven' is '5'; the right position (or r.pos) of 'leven' is '4', since it is followed by three words. So, the l.pos of 'leven' is '5', and its r.pos is '4'. Second, the software determines the position of the second variant in the first text of the second group: it determines the position of 'bos' in text 11. Suppose that it is the sixth word of a verse with nine words. Then, the l.pos of 'bos' is '6' and its r.pos is '4'. Third, the software compares the l.pos'es of the variants; if they are equal, it is concluded that the variants stand in the same variation place; if the l.pos'es are different, the software compares the r.pos'es of the variants. In our example the l.pos'es are different ('5' and '6'); but the r.pos'es are equal ('4' and '4'). In that case, it has been determined that characteristic 1 has not been violated. But suppose that the variants would have been standing in different variation places. Then the variants get a second chance: the whole procedure is repeated, but now with the second text of the first type-2 group (text 02) and the second text of the second group (text 12).

One example of a characteristic 1 variation:

02.0009 05 ^comb.: 01-14-|06-07-08-="~sanderin"|"ig" (^:vp;1)

This variation formula expresses that texts 01 and 14 (near verse 9 of text 02) show '~sanderin' (i.e. 'sanderin' in rhyming position), where the German texts 06, 07 and 08 have 'ig'. A combination of both variants into a formula for these 5 texts is possible; however, as is expressed by '(^:vp;1)' (read: this is not (= '^') a good combination, because (= ':') the variants belong to different variation places or variation places (= 'vp'), as is expressed by (= ';') characteristic '1'), the combination of the variants into a type-2 formula must be rejected (= '^comb.').

III.a.3 The sixth component, concerning characteristics 6 and/or 7

Often it is difficult to decide whether a pair of variants fall under characteristic 6 (on accidentals, like orthographical differences or differences in word boundaries) or under charac- teristic 7 (on other kinds of parallelisms). It is, for instance, difficult to decide whether two variants 'hebbe' and 'hebben' are covered by characteristic 6 (the difference is a small orthographical difference) or characteristic 7 (the difference is a difference in inflection or conjugation). Therefore, characteristics 6 and 7 are presented and treated here together in one section. The order of presentation or discussing these elements below is according to the types of characteristics: first, characteristic 6a is discussed, then 6b, then 7a, then 7a in combination with 6a, 7b, 7c, 7c in combination with 7a, and, finally, 7d. Second, concrete examples are offered.

|	:	General sign for 'versus'; e.g. 'd|t', which means that difference between the variants is that one word has a 'd' where the other word has a 't'.
?	:	General sign to express my doubts about the importance of the difference between the variants; I use this sign for instance when I am almost, but not totally, convinced that the importance is small; later on, the evaluation of the variations will show whether their importance is small indeed.
^	:	General sign for 'not' or 'rejection' or 'incorrectness; e.g. '^comb.', which is the shorthand for 'not a good, text-genealogically informative, combination of variants'.
(**<:** ...)	:	General shape of a small difference ('<') expression; it indicates that the difference(s) between the variants is small and therefore text- genealogically insignificant.
(<: ...;**6a**)	:	Small difference expression; the difference between the variants is labelled to

be small because characteristic 6a ('an orthographical difference is not text-genealogically informative') tells us so.

(<:2ch;**6a**) : Small difference expression; the difference between the variants consists of a double character in one set of texts where the other set of texts has a single character; this is a small, text-genealogically unimportant, difference, covered by characteristic 6a.

split ...;**6b** : Indicator of the fact that the software has split up a single word in the shorthand versions of one or more texts into two separate words or word parts, because these two word parts have been detected in one or more other (shorthand) text versions; characteristic 6b claims that differences in word boundaries are not genealogically significant.

(<: ...;**7a**) : Small difference expression; the difference between the variants is labelled to be small because characteristic 7a ('mere differences in declination or conjugation are not genealogically significant') tells us so.

(?<:affix(es)?;**7a**): As an addition to the previous rule: an affix is a prefix (at the start of a word: 'be' or 'ge' or 'ver' or 'ont' or 'on') or a suffix (at the end of a word: 'es' or 'et' or 't' or 's' or 'en' or 'er' or 'r' or 'n' or 'e'). The question mark(s) expresses that I am not absolutely sure whether the differences between affixes are text-genealogically uninformative indeed. A later evaluation has to show whether my assumption is correct that these differences are unimportant.

(<: ...;**7a**;**6a**): Small difference expression; the difference between the variants is labelled to be small because both characteristics 7a and 6a tell us so; in other words, both characteristics express that the difference is text-genealogically unimportant; however, characteristic 7a seems to be more important in this case than characteristic 6a; therefore characteristic 7a has been mentioned before 6a.

(<:2ch;fin-...;**7a**;**6a**): Small difference expression; the difference between the variants consists of a double character in combination with a final 'e', 'n' or 'en' in one set of texts where the other set of texts has a single character; this is a small, text-genealogically unimportant, difference, covered by characteristics 7a and 6a.

(<: ...;**7b**) : Small difference expression; the difference between the variants is labelled to be small because characteristic 7b ('when the difference between variants is a difference in vowels, this difference is not genealogically informative') tells us so.

(<:GD ...;**7c**): Small 'German-Dutch' difference expression; the difference between the variants is labelled to be small because characteristic 7c (a.o.: 'when variants are caused by differences in languages or dialects, they do not provide dependable genealogical information') tells us so. 'GD' is the shorthand for 'German-Dutch difference'; texts 06, 07 and 08 have been printed in Cologne, at the beginning of the sixteenth century. Texts 01 to 05 and 09 to 14 were printed or written/copied in places within current Belgium and the Netherlands.

(<:GD ...;**7c**;**7a**): Small GD difference expression; the difference between the variants is labelled to be small because characteristics 7c and 7a, in that order, tell us so. (See also the previous description of (<:GD ...;7c)).

(^:names ... ;**7d**): Characteristic 7d expresses amongst others that synonymous or highly equal names are text genealogically uninformative; when the variation formula has two highly equal names, the variants have no ('^') text-genea-

logical value. I have taught the computer to recognize the names of Lanseloet, Sandrijn, Reinout, Johan, Jesus, Christ, Maria and Simon (and derived, inflected variant forms of these names).

(diff. names ...;**7d**): (An addition to the previous rule:) When the variants concern different names of different persons, it is likely that these variants are text-genealogically informative.

(^:only 1 name;**7d**): When one variant is a name, while the other is not, it is likely that both variants are text-genealogically important. Later on, I realized that this rule is too powerful; it may be possible that one variant is a name (like 'Sandrijn') while the other variant is a noun (like 'vrouwe' or 'woman') and that both variants are text-genealogically informative. Happily, as I checked out, this error or bug has not influenced the results.

Concrete examples of the sixth component

(<:(aw)d;**6a**) : The difference concerns the characters 'd' in combination with the vowel 'aw' (in current Dutch represented by 'ou' or 'au'); characteristic 6a states that this is a small, text-genealogically irrelevant difference.
Example: 02.0081 09 ^comb.: 09-10-|01-02-05-11-12-13-14-= "~hawen"|"~hawden" (<:(aw)d;6a) (wds r.p;5)

(<:f|v;**6a**) : The difference concerns the character 'f' in one set of texts versus the character 'v' in the other set of texts; characteristic 6a states that this is a small, text-genealogically irrelevant difference.
Example: 02.0020 11 ^comb.: 04-05-06-07-08-|09-10-11-12-13-14-= "frawe"|"vrawe" (<:f|v;6a)

(<:t|d;**6a**) : The difference concerns the character 't' in one set of texts versus the character 'd' in the other set of texts; characteristic 6a states that this is a small, text-genealogically irrelevant difference.
Example: 02.0267 13 ^comb.: 01-04-05-09-10-11-|02-06-07-08-12-13-14-="ten"|"den" (<:t|d;6a) (^:W1=Mx;W2=Ar;4b-)

(<:(n)g|(n)k;**6a**) : The difference concerns the characters 'g' or 'ng' in one set of texts versus 'k' or 'nk' in the other set of texts; characteristic 6a states that this is a small, text-genealogically irrelevant difference.
Example: 02.0020 10 ^comb.: 12-13-|02-04-05-06-09-10-11-14-="jong"| "jonk" (<:(n)g|(n)k;6a) (^:W1=Aj;W2=Aj;4a+;4b-)
Example: 02.0205 12 ^comb.: 11-12-13-14-|02-04-05-06-07-08-09-10-= "hoghit"|"hokhit" (<:(n)g|(n)k;6a)

(<:2ch;**6a**) : The difference concerns double characters ('2ch') occurring in one set of texts while in the other set of texts a single character occurs; characteristic 6a states that this is a small, text-genealogically irrelevant difference.
Example: 02.0785 09 ^comb.: 12-13-|01-02-04-05-09-10-11-="gekwollen"| "gekwolen" (<:2ch;6a)

(<:e;?;**6a**) : The difference between the two variants is a character 'e' (possibly with a not mentioned double character); I think this is a insignificant, non-genealogical difference as expressed by characteristic 6a, but I am not totally convinced; my doubts are expressed by the ';?;'.
Example: 02.0164 07 ^comb.: 02-05-10-|09-11-12-13-="mint"|"minnet" (<:e;?;6a)
Example: 02.0170 08 ^comb.: 02-05-06-|09-10-11-12-13-="bernt" |"bernet" (<:e;?;6a)

(<:en;?;**6a**) : The same as (<:e;?;6a), but now in combination with the (non-final) characters 'en'.
Example: 02.0342 07 ^comb.: 07-08-|05-09-11-12-13-="lanslotens" |"lanslots" (<:en;?;6a) (^:names with > prox. 0.88;7d)

(<:n;?;**6a**) : The small difference between the variants consists of a non-final character 'n'. For the moment, I think that this is a text-genealogically irrelevant difference; however, I am not sure about it, which is expressed by the question mark.
Example: 02.0252 10 ^comb.: 01-02-12-13-14-|04-05-09-10-11-= "pinsen"|"pisen" (<:n;?;6a)

split ...;**6b** : The computer has split up a word to avoid that differences in word boundaries lead to incorrect text-genealogical observations, as is expressed by characteristic 6b.
Example: 02.0641 split: *darom* (in 09-) in t. 09-10-11-12-13- --> *dar om* (in 09-), based on t. 01-02-05-06-07-;6b
This example must be interpreted as follows: the computer has detected that the single word 'darom' in texts 09 to 13 (this word may have several variant forms, e.g. 'daromme', in these five texts; in text 09 the form is 'darom') appears as two words in texts 01-02-05-06-07; therefore, 'darom' in the texts mentioned has been split up into two words 'dar' and 'om' (of course 'daromme' will be split up into 'dar' and 'omme')

(<:fin-e;**7a**) : The difference between the variants concerns the final character 'e' in one of the variants; according to characteristic 7a this is text-genealogically uninformative.
Example: 02.0014 13 ^comb.: 09-10-11-12-13-14-|01-02-04-05-06-07-08-="hore"|"hor" (<:fin-e;7a)

(<:fin-en;**7a**) : The difference between the variants concerns the final characters ‘en’ in one of the variants; according to characteristic 7a this is text-genealogically uninformative.
Example: 02.0112 11 ^comb.: 01-02-05-06-|07-09-10-11-12-13-14-=
"weten"|"wet" (<:fin-en;7a)

(<:fin-n;**7a**) : The difference between the variants concerns the final character ‘n’ in one of the variants; according to characteristic 7a this is text-genealogically uninformative.
Example: 02.0311 11 ?comb.: 06-07-|01-02-04-05-09-10-11-12-13-=
"hebbe"|"hebben" (<:fin-n;7a) (W1=Au;W2=Au;4a+;4b?;ok?)

(?<:affix(es)?;**7a**) : The difference between the variants concerns affixes (prefixes and/or suffixes); according to characteristic 7a this is a text-genealogically irrelevant difference. I still have some doubts, as is expressed by the question mark. Evaluation will learn whether these doubts are correct.
Example: 02.0016 11 ?comb.: 07-08-|02-04-05-09-10-11-12-13-14-
="herts"|"herte" (?<:affix(es)?;7a)
Example: 02.0065 11 ?comb.: 02-06-07-08-|05-09-10-11-12-13-14-=
"misselike"|"misseliker" (?<:affix(es)?;7a)

(?<:affix(es) (+d|t;**7a**): Again, the difference concerns affixes, but now in combination with a difference between the characters ‘d’ and ‘t’.
Example: 02.0057 11 ?comb.: 11-12-13-14-|02-04-05-06-07-09-10-=
"~spinder"|"~spint" (?<:affix(es) (+d|t);7a) (wds r.p;5)

(?<:affix(es) (+f|v;**7a**): Idem, but now with the characters ‘f’ and ‘v’.
Example: 02.0039 08 ?comb.: 02-06-07-08-|01-04-05-10-="gevet"| "geft"
(?<:affix(es) (+f|v);7a)

(?<:wil|waw;**7a**) : The difference between the variants may concern a difference between ‘wil’ and ‘waw’ (‘wou’), which are two different forms of the verb ‘willen’. I wanted to investigate whether both forms of the verb ‘willen’ and other auxiliaries are parallelistic and therefore text-genealogically unimportant. I have my doubts about this, as is expressed by the question mark.
Example: 02.0149 12 ?comb.: 02-05-06-07-08-10-|01-09-11-12-13-14-=
"wilde"|"wawde" (?<:wil|waw;7a) (W1=Au;W2=Au;4a+;4b?;ok?)

(<:2ch;fin-e;**7a**;**6a**) : The same as (<:2ch;6a) (see above), in combination with an extra text-genealogically unimportant difference: a final character ‘e’.
Example: 02.0010 12 ?comb.: 02-04-12-13-14-|01-05-06-07-09-10-11-=
"heb"|"hebbe" (<:2ch;fin-e;7a;6a) (W1=Au;W2=Au;4a+;4b?;ok?)

(<:2ch;fin-en;**7a**;**6a**): The same as (<:2ch;6a), in combination with an extra text-genealogically unimportant difference: the final characters ‘en’.
Example: 02.0534 05 ^comb.: 07-08-|11-12-13-="mennig"|"menigen"
(<:2ch;fin-en;7a;6a) (^:W1=Pn;W2=Pn;4a+;4b-)

(<:2ch;fin-n;**7a**;**6a**) : The same as (<:2ch;6a), in combination with an extra text-genealogically unimportant difference: a final character ‘n’.
Example: 02.0270 08 ^comb.: 05-10-|02-09-11-12-13-14-=
"opersten"|"opperste" (<:2ch;fin-n;7a;6a)

(<:d|t;fin-e;**7a**;**6a**) : The difference concerns the characters ‘d’ in one set of texts versus ‘t’ in the other set of texts; furthermore one set of texts (most likely the one with the character ‘d’) has a final ‘d’; characteristic 6a states that this is a small, text-genealogically irrelevant difference.
Example: 02.0073 12 ^comb.: 02-10-11-12-13-14-|01-05-06-07-08-09-=
"got"|"gode" (<:d|t;fin-e;7a;6a)

(<:d|t;fin-en;**7a**;**6a**): The same as (<:d|t;fin-e;7a;6a), but now with the final characters ‘en’.
Example: 02.0129 07 ^comb.: 11-12-13-|01-05-09-10-="sgant"|"sganden"
(<:d|t;fin-en;7a;6a)

(<:fin.t;**7a**;**6a**) : The difference between the variants concerns the final character ‘t’ in one of the variants; according to characteristic 7a (and also characteristic 6a) this is text-genealogically uninformative.
Example: 02.0088 10 ^comb.: 06-07-08-|02-05-09-10-11-12-13-=
"legget"|"legge" (<:fin.t;7a;6a)

(<:fin.t|d;**7a**;**6a**) : The difference concerns the final character ‘t’ in one set of texts versus the final character ‘d’ in the other set of texts; characteristics 7a and 6a state that this is a small, text-genealogically irrelevant difference.
Example: 02.0343 07 ^comb.: 12-13-14-|05-09-10-11-="t"|"d"
(<:fin.t|d;7a;6a) (^:W1=Mx;W2=Ar;4b-)

(<:f|v;fin-e;**7a**;**6a**) : The same as ‘(<:f|v;6a)’, but now the difference concerns the character ‘f’ in one set of texts versus the character ‘v’ in the other set of texts, but now in combination with a final character ‘e’; characteristic 7a and 6a state that this is a small, text-genealogically irrelevant difference.
Example: 02.0046 09 ^comb.: 02-04-05-|09-10-11-12-13-14-="blif"| "blive"
(<:f|v;fin-e;7a;6a)

(<:f|v;fin-en;**7a**;**6a**): The same as the previous example, but now with the final characters ‘en’.
Example: 02.0107 11 ^comb.: 01-02-05-|06-07-08-09-10-11-12-13-=
"werf"|"werven" (<:f|v;fin-en;7a;6a)

(<:g|k+f|v;fin-e;**7a**;**6a**): The small, text-genealogically unimportant, difference concerns a ‘g’ in one set of texts versus a ‘k’ in the other set of texts, combined with a difference concerning a ‘f’ in one set of texts, versus a ‘v’ in the other set of texts in combination with a final character ‘e’; admittedly, this is more or less an ‘ad hoc’ rule.
Example: 02.0724 04 ^comb.: 01-02-|12-13-="jonkfraw"|"jongvrawe"
(<:g|k+f|v;fin-e;7a;6a)

(<:e|1vow.;**7b**) : The difference concerns the vowel (or schwa) ‘e’ in one variant, were the other variant has another vowel; characteristic 7b expresses that when the difference between variants is a vowel, this is not a text-genealogically relevant difference. I have split up the difference between vowels in two categories: this category, concerning one ‘e’ and another vowel, and another category, where the difference concerns two vowels that are both

other vowels than an ‘e’. The reason to create both categories, is that I have no doubt that the ‘e’-category (<:e|1vow.;7b) is text-genealogically uninformative; I have small doubts that the other category concerning non-vowels (?<:vow.;7b) maybe is text-genealogically informative.
Example: 02.0024 06 ^comb.: 12-13-|04-05-09-11-="~eglantir"|"~eglentir" (<:e|1vow.;7b) (wds r.p;5)
Example: 02.0066 10 ^comb.: 01-04-08-|02-09-10-11-12-13-14-= "werden"|"worden" (<:e|1vow.;7b)

(?<:vow.;**7b**) : The difference between the variants is a difference between vowels; according to characteristic 7b this is a text-genealogically irrelevant difference. I still have some small doubts, as is expressed by the question mark. Evaluation will learn whether these doubts are correct.
Example: 02.0018 13 ?comb.: 07-08-|01-02-04-05-06-09-10-11-12-13-14-="awgen"|"ogen" (?<:vow.;7b)
I repeat here that the shorthand ‘aw’ in current Dutch would have been represented by ‘ou’ or ‘au’.
Example: 02.0066 09 ?comb.: 06-07-|02-09-10-11-12-13-14-="warden"| "worden" (?<:vow.;7b)
Example: 02.0092 12 ?comb.: 01-02-05-06-07-08-|09-10-11-12-13-14-= "verhogen"|"verhugen" (?<:vow.;7b)

(<:GD f|p;**7c**) : The small difference concerns a difference between a German word which has an ‘f’ where the Dutch word has a ‘p’. See also the remarks in the explanation of ‘(<:GD (t)s|t;7c)’.
Example: 02.0241 10 ^comb.: 06-07-|01-02-04-05-09-11-12-13-="slafen"| "slapen" (<:GD f|p;7c)

(<:GD g|k;**7c**) : The small difference concerns a difference between a German word which has an ‘g’ where the Dutch word has a ‘k’. See also the remarks in the explanation of ‘(<:GD (t)s|t;7c)’.
Example: 02.0201 11 ^comb.: 07-08-|01-02-05-06-09-10-11-12-13-= "sogt"|"sokt" (<:GD g|k;7c)

(<:GD (t)s|t;**7c**) : The small difference concerns a difference between a German word which has an ‘s’ or ‘st’ where the Dutch word has a ‘t’. One could claim that this difference is a small characteristic-6a-difference. However, this would make characteristic 6a too powerful. The incorrect result would be that when to Dutch variants differ in an ‘s’ and a ‘t’, the enhanced character 6a would label this, incorrectly, as an insignificant, text-genealogically unimportant difference.
Example: 02.0139 07 ^comb.: 06-07-08-|01-05-10-14-="hertse"|"herte" (<:GD (t)s|t;7c)

(<:GD (t)s|t;fin-e;**7c**;**7a**): The same as (<:GD (t)s|t;7c), but now in combination with the final character ‘e’.
Example: 02.0040 04 ^comb.: 02-04-|06-07-="hert"|"hertse" (<:GD (t)s|t;fin-e;7c;7a)

(<:GD (t)s|t;fin-en;**7c**;**7a**): Idem, but now with the final characters ‘en’.
Example: 02.0839 05 ^comb.: 12-13-|06-07-08-="herte"|"hertsen" (<:GD (t)s|t;fin-n;7c;7a)

(<:GD (t)s|t;fin-n;**7c**;**7a**): Idem, but now with the final character ‘n’.
Example: 02.0839 05 ^comb.: 12-13-|06-07-08-="herte"|"hertsen" (<:GD (t)s|t;fin-n;7c;7a)

(clause headers;**7d**): Both variants are names and they are clause headers.
Example: 02.0007 12 ^comb.: 02-04-10-|05-06-07-08-09-11-12-13-14-= "lantslot"|"lanslot" (clause headers;7d) (^:names with > prox. 0.93;7d)

(^:names with > prox. ... ;**7d**): One or both variants are names. They have a high proximity, i.e. they are very much alike. Characteristic 7d states that in that case the variants are text-genealogically unimportant. Marc Olsen has explained in his article ‘Theory and Applications of Inexact Pattern Matching in Humanities’ (in: Proceedings of the Third International Conference on Symbolic and Logical Computing. Edited by Eric Johnson. Dakota (Dakota State College) 1988, pp. 176-191) how the similarity (or proximity) between two words or ‘strings’ can be expressed by a number. With the help of my true friend Dr. P.A. Coppen Johnson’s proximity algorithm was put into a Assembler-routine, that I could use in my software. Proximity is expressed by a number between 0 and 1. I decided that when two words have a lower proximity than 0.60, it is likely that both words are different words. When the proximity is equal or higher than 0.60 it is likely that both words go back to the same base word. See also: Salemans & de Bonth 1991, note 33 on p. 225.)
Example: 02.0043 11 ^comb.: 01-14-|04-05-06-07-08-09-11-12-13-="sanderin" "sandrine" (^:names with > prox. 0.87;7d)

(diff. names with < prox. ...;**7d**): The variants are names. They have a low proximity, i.e. the names are different. Characteristic 7d states that in that case the variants can be text-genealogically important.
Example: 02.1006 10 comb.: 09-11-12-13-|02-05-06-07-08-10-="isum"| "maria" (diff. names with < prox. 0.22;7d)

(^:only 1 name;**7d**): When one variant is a name, while the other is not, it is not likely that both variants are text-genealogically important.
Later on, I realized that this rule is too powerful; it may be possible that one variant is a name (like ‘Sandrijn’) while the other variant is a noun (like ‘vrouwe’ or ‘woman’) and that both variants are text-genealogically informative. Happily, as I checked out, this error or bug has not influenced the results. (Perhaps near 02.1006 one could say that ‘gristum’ and ‘maget’ are text-genealogical variants.)
Example: 02.1006 08 ^comb.: 02-07-08-10-|09-11-12-13-="di"|"isum" (^:W1=Mx;4b-) (^:only 1 name;7d)

III.a.4 The seventh component, concerning characteristic 4

Characteristics 4 expresses that text-genealogical variants must belong to the same word classes (= characteristic 4a) and must be substantives or verbs, except auxiliaries of tense or frequently used verbs (= characteristic 4b). Because I did not have the possession of a syntactic parser (that analyses the syntactic structure of a verse or sentence) nor a morphological parser (that analyses word forms and could see, for instance, that words like 'rode', roder' and 'roden' are derived forms from the adjective 'rood'/'rot'), I decided to define non-verbal and non-substantive categories, like adjectives, adverbs, articles, auxiliaries or frequently used verbs, conjunctions, prepositions and pronouns. According to the theory, variants belonging to these categories have no text-genealogical value (although I have my doubts on the categories adjectives and auxiliaries). Therefore, type-2 variation formulas built with the categories mentioned can be rejected (==> ^comb). By doing so, I hoped that the remaining type-2 variation formulas, (mainly) concerned substantives and verbs.

First, with the help of a concordance of all the words in all the *Lanseloet van Denemerken* texts (in shorthand notation) I built a list of word categories. Then I ran my computer software, looked at the results and adapted the categories.

Sometimes, a word is ambiguous, belonging to more than one word category. When none of these word categories concerned are substantives or verbs (the 'good' categories), I decided to arrange them under the Mixed category.

It is also possible that a word actually belongs to two or more word categories, while it is labelled in my software as if it belongs to one (rejectable) category. Take, for example the word 'dat' in verse 02.969. In this verse 'dat' is the shorthand of the substantive 'daad'. However, this word does not belong to a type-2 variation, since it only occurs in a single text. Then, it is harmless, since the software is instructed to treat only type-2 variations.

```
In the software the following word categories have been defined that are not substantives or
verbs (except for frequently used verbs and auxiliaries):

Adjectives (Aj):
AJ = ' alt awt bas bat besser beter bitter drovig edel edelen edelste ertsgen '
+  'fir fris frisger frisser gawde gawt golden grakios gratios gratius grone '
+  'grose grosse grossen grosser grot grote groten groter gulden guldin hilge '
+  'hilige hog hoge hogen jong jonge jonk jun latste leste liver loalder '
+  'nederen noalder rin rine rode roder roden rojalder sgon sgone sgonder sot '
+  'sgonre sote soten sterk stinkenden swar valsge valsger vast veste vro vrog '

Adverbs (Av):
  AV = ' a aldus also altit altos awg darom daromme dus emmer ergens ewelig '
+  'ginder hir ho immer immers nemmermer nergens ni nimmerme nimmermer niuwers '
+  'nit nog nogtan nogtans nogte not nu nummerme o og ok ot seker ser sere '
+  'siger so sus ummers wel '

Articles (Ar):
 AR = ' d der dem den ene enen inen '

Auxiliaries or frequently used verbs (Au):
 AU = ' dot es hadde han hat haven heb hebbe hebt hebben hedde heft is ist lat '
+  'mag mogt mos most mot sal saw sawde sawt solde soldet solle solt sulde '
+  'sullen was waw wawde wawt wil wilde wolde woldet '
 Remark: I have taught the computer, that 'wawde' near verses 02.0114, 02.0493 and 02.0630 has
         been derived from the noun 'wawt' ('wout', English 'bush'), and, then, therefore,
         does not belong to the AU-category

Conjunctions (Co):
 CO = ' als ende howel int mar mer oft ofte unt wanner want '

Prepositions (Pp):
 PP = ' af an bi binnen boven dor dur met mit na ondanks op over ter sonder '
+  'sunder tegen tot tso up ut van vor vore '

Pronouns (Pn):
 PN = ' alder alle allen aller alre ander andere anderen dese desem desen '
+  'deser dins elk elke enig enigen et gen gene genen genre gi gin giner '
+  'ginen har hare haren hars he hem hi hun ig ik ir iren irs it menig '
+  'menige menigen mennig mi minre minder minen miner mins mir mire ons onse '
+  'onsen se selfde selve si sinder sinen siner sulks u ug unse ur ure us uw '
+  'uwen uwer uwers uwes vel vil wat welk welke wi wir '
```

Mixed category:
MX = ’ al da dan dar dat de des di din dis dit do en ens hen het i im in of om s sin ’
+ ’s sin t te ten to um wan wart wat wert wilt ’
Remark: In the *Lanseloet van Denemerken* text verions ‘het’ is a pronoun or an article. Since pronouns and article do not belong to the categories substantives or verbs, I labelled ‘het’ as a word falling under the Mixed category. I have told the computer, that ‘het’ near verses 02.0482 and 02.0906 has been derived from the verb ‘heten’, and, therefore, does not belong in these cases to the Mixed category. (Besides, ‘het’ occurs as article in texts 09 to 14 only; apparently, the article ‘het’, as we know it, is in use since about, roughly speaking, the second half of the sixteenth century.) Another example: ‘wilt’ is an adjective or an auxiliary, which both are non-genealogical word categories. Therefore, I labelled ‘wilt’ as an element of the Mixed category. I have taught the computer that ‘wan’ near 02.0398 and 02.0631 is a verb.

Concrete examples of the seventh component, concerning characteristic 4

a. 02.0020 10 ^comb.: 12-13-|02-04-05-06-09-10-11-14-="jong"|"jonk" (<:(n)g|(n)k;6a) (^:W1=Aj;W2=Aj;4a+;4b-)
Interpretation: Near verse 20 of base text 02 we find a combination of two variants, occurring in 10 texts, with which a type-2 variation formula ‘12-13-|02-04-05-06-09-10-11-14-’ can be built; however, this is not a genealogically adequate formula (= ‘^comb.’), for 2 reasons; the first reason is that the difference between the first variant ‘jong’ (occurring in texts 12 and 13) and the second variant ‘jonk’ (occurring in texts 02, 04, 05, 06, 09, 10, 11 and 14) is small (‘<’); it is a small difference between the characters ‘g’ and ‘k’; therefore, characteristic 6a states that the combination of both variants is text-genealogically uninformative; the second reason is that the first variant belongs to the category of Adjectives (‘W1=Aj’), as well as the second variant (‘W2=Aj’); logically, both variants belong to the same word classes by which the test on characteristic 4a, which states that variants must belong to the same word class, is fulfilled (‘4a+’); however, the variants are not substantives or verbs, as has been ordered by characteristic 4b; because characteristic 4b is violated (‘4b negative’ or ‘4b-’), the variation formula has to be rejected (‘^comb.’ and ‘^:’). We must read the passage ‘(^:W1=Aj;W2=Aj;4a+;4b-)’ as follows: this is not (‘^’) a good variation (formula), because (‘:’) the first variant is an adjective (‘W1=Aj’) and the second variant is an adjective (‘W2=Aj’); this is in accordance with characteristic 4a (‘4a+’), but not in accordance with characteristic 4b; the test on characteristic 4b is negative (‘4b-’).
b. 02.0028 13 ^comb.: 06-14-|01-02-04-05-07-08-09-10-11-12-13-="edele"|"edel" (<:fin-e;7a) (^:W2=Aj;4b-)
Interpretation: Near verse 28 of base text 02 we find a combination of two variants with which a type-2 variation formula ‘06-14-|01-02-04-05-07-08-09-10-11-12-13-’ can be built; however, this is not a good genealogical formula (= ‘^comb’), for two reasons; the first reason is that the difference between the first variant ‘edele’ (occurring in 06 and 14) and the second variant ‘edel’ (occurring in texts 01, 02, 04, 05, 07 to 13) concerns a final character ’e’; characteristic 7a states that this difference is text-genealogically uninformative (‘<:fin-e;7a’); the second reason is that the second variant belongs to the category of Adjectives ‘W2=Aj’); although the first variant is not to be found in any defined word category (therefore ‘W1=’ is not mentioned), the variation formula has to be rejected, because it is sure that at least one of the variants does not belong to the word categories verb or substantive as characteristic 4b orders; in other words, the test on characteristic 4b is negative (‘4b-’) and therefore the variation formula has to be rejected (‘^comb.’ and ‘^:’).
c. 02.0040 10 ^comb.: 06-07-08-|02-05-09-11-12-13-14-="tso"|"mi" (^:W1=Pp;W2=Pn;4a-)
Comment: Because the first variant W1 ‘tso’ is a preposition and the second variant W2 ‘mi’ is a pronoun, the test on characteristic 4a, by which is expressed that two variants must belong to the same word class, gives a negative result; therefore the variation formula has to be rejected (‘^comb.’).
d. 02.0053 11 ^comb.: 06-07-08-|02-04-09-10-11-12-13-14-="wesen"|"sin" (^:W2=Mx;4b-)
Comment: The computer does not know to which category the first variant W1 ‘wesen’ belongs, since this word is not to be found in one of the word categories; therefore the test on characteristic 4a whether both variants belong to the same word categories, can not be performed. Neither does the computer know the precise category of the second variant W2 ‘sin’: ‘sin’, the shorthand notation of the pronoun ‘sijn’, or of the frequently used verb or auxiliary ‘sijn’. When we could have used a syntactic parser, it would have been possible to determine precisely the word category to which ‘sin’ belongs. However, because ‘sin’ is a pronoun or a frequently used verb or auxiliary, we do know that it is word that does not belong to desired category ‘substantive’ or ‘not frequently used verb that is not an auxiliary’. Therefore, we have put ‘sin’ under the Mixed category. And because W2 belongs to the text-genealogically uninformative Mixed category, the computer knows that the variation formula built with a variant belonging to the Mixed group, has to be rejected (‘^comb. and ‘^:’)
e. 02.0064 08 ^comb.: 02-04-05-09-|10-11-12-13-="gawen"|"golden" (^:W2=Aj;4b-)
Comment: The computer recognizes only the second variant ‘golden’ as to belong to the word category Adjective (‘W2=Aj’); therefore, the test on characteristic 4a is not possible; but the test on characteristic 4b is negative, which is reason enough to reject the variation formula.
f. 02.0185 05 ?comb.: 07-08-|01-02-05-="han"|"wawde" (W1=Au;W2=Au;4a+;4b?;ok?)
Comment: Both variants are auxiliaries; since they belong to the same word categories the test on characteristic 4a is positive; my theory states a.o. that good genealogical variants may not belong to the word class of auxiliaries; however, I still have some doubts whether this is correct;

```
                    these doubts are expressed by the question mark: with ‘4b?;ok’ I try to
                    express that I have doubts if the test on characteristic 4b leads to a
                    rejection or an acceptance of the variation formula. Because of my doubts
                    I will not use this kind of questionable variation formulas for the
                    development of the Lanseloet van Denemerken tree; we will build this tree
                    with other, more trustworthy variation formulas; when this tree is
                    trustworthy, we can evaluate the more questionable formulas and possibly
                    detect whether different auxiliaries are in accordance with the tree or
                    not; if they are not, it is likely that auxiliaries do not have
                    text-genealogical importance.
g. 02.0753 07 ^comb.: 06-07-08-|09-11-12-13-="int"|"ik" (^:W1=Co;W2=Pn;4a-)
             Comment: The variants belong to different word categories: W1 ‘int’ is a (German)
                    conjunction, and W2 ‘ik’ is a pronoun; since they belong to different word
                    word categories, the test on characteristic 4a is negative; therefore, the
                    variation formula has to be rejected (‘^comb.’ and ‘^:’).
h. 02.0141 12 ?comb.: 02-05-11-12-13-|01-06-07-08-09-10-14-="wil"|"wilt" (<:fin.t;7a;6a)
                    (W1=Au;W2=Mx;4b?;ok?)
             Comment: It is not precisely known whether both words belong to the same word
                    categories, since ‘wilt’ belongs to the mixed word category: it can be
                    for instance an auxiliary or an adjective; therefore, it is impossible to
                    say, without syntactic knowledge, that characteristic 4a is negative or
                    positive; however, we do know that both words are not main verbs or
                    substantives, the word categories we are mainly interested in; therefore,
                    the variation formula has to be rejected (‘^comb.’ and ‘^:’) on the basis
                    of characteristic 4b. The formula expresses also another good reason
                    to reject the formula: the difference between both variants, consisting
                    of a final consonant ‘t’ is very small.
```

III.a.5 The eighth component, concerning characteristic 5 (possibly in combination with characteristic 9)

Characteristic 5 expresses that variants in rhyming position in verses are text-genealogical, regardless of the word class they belong to. Therefore, characteristic 5 can put out of order characteristic 4 (in which the word classes the variants belong to play a central role). For efficiency reasons the software tests characteristic 5 before characteristic 4. Of course variants that fall under characteristic 5 must be in accordance with other characteristics, like characteristics 6 and 7.

Concrete examples of the eighth component, concerning characteristic 5 (and 9)

```
a. 02.0009 13 ^comb.: 01-14-|02-04-05-06-07-08-09-10-11-12-13-="~sanderin"|"~sandrin" (<:e;?;6a)
                    (wds r.p;5) (^:names with > prox. 0.93;7d)
              Comment: The variants ‘sanderin’ and ‘sandrin’ are in rhyming position, as denoted
                    by the ‘~’-sign. Notice that ‘sanderin’ and ‘sandrin’ are not clause
                    headers here: else ‘(clause headers;7d)’ would have been mentioned.
                    position in verses.
b. 02.0017 13 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-="tso"|"~an" (^wds r.p;5)
             Comment: The variation formula is rejected because both variants are not both
                    standing in rhyming position. (Notice that ‘tso’ does not have a ‘~’-sign,
                    which would have denoted that it was in rhyming position.) One could claim
                    that this is the same as a violation of characteristic 1, which states
                    that variants must be in the same variation place. However, the
                    detection of a violation of characteristic 1 is more subtle, since it
                    tests both the left and right position of the variants, while
                    characteristic 5 only speaks of variants in rhyming position, which is
                    only seen from the right position (see the description of characteristic
                    1 above). ‘tso’ is in text 06 in the sixth position from the left and in
                    the second position from the right; ‘~an’ is in sixth position from the
                    left in base text 02 and in the first position from the right. Therefore,
                    both words agree in their left position, by which the test on
                    characteristic 1 does not fail. The test on characteristic 5, dealing
                    with rhyming positions, does fail.
c. 02.0018 13 ^comb.: 06-07-08-14-|01-02-04-05-09-10-11-12-13-="~sgawen"|"~sgawe" (<:fin-n;7a)
                    (wds r.p;5)
             Comment: Although both variants are in rhyming position, the variation formula is
                    rejected because characteristic 7a has been violated.
d. 02.0492 11 ^comb.: 01-11-12-13-|02-05-06-07-08-09-10-="~rip"|"~rit" (wds r.p;5) (conventions
                    pure rhyme violated;9a)
             Comment: Both variants are in rhyming position. But at a very early stage (when
                    the rhyming pairs of the texts are determined, which is the basis for the
                    development of the synoptic text) has been detected that there is
                    something wrong in the rhyme. This is expressed by the accompanying
                    observation ‘02.0492 ?obs02: conventions pure rhyme violated in pair
                    (~slip - ~rit) of texts 02-05-06-07-08-09-10- (near 02.491);T2?;9a’
                    Characteristic 9 expresses that when the variants are in rhyming position,
                    they have to obey rhyming conventions. Because the software has detected
                    a violation of these conventions in our example, the variation formula is
```

```
                    rejected (‘^comb.’).
e. 02.0082 09 ^comb.: 05-06-07-08-|01-11-12-13-14-="~besgawden"|"~gesgawden" (?<:affix(es);7a)
                    (wds r.p;5) (conventions pure rhyme violated;9a)
             Comment: Both variants are in rhyming position. Because I have doubts about the
                    genealogical value of affixes, as has been explained above when discussing
                    characteristic 7a, the question mark in ‘?<:affix(es)’) expresses my
                    doubts. It is detected that the conventions of pure rhyme have been
                    violated, which is expressed by the observation ‘02.0082 ?obs02:
                    conventions pure rhyme violated in pair (~huden - ~besgawden) of texts
                    06-07-08- (near 02.81);T2?;vowels;9a’. Therefore, the formula is rejected:
                    ‘^comb’.
f. 02.0991 12  comb.: 07-08-|01-02-04-05-06-09-10-11-12-13-="~van"|"~an" (wds r.p;5)
             Comment: The software considers this variation formula to be correct. Notice that
                    both ‘van’ and ‘an’ (in rhyming position notated as ‘~van’ and ‘~an’)
                    have been defined as prepositions, as has been discussed above near
                    characteristic 4. Normally, variation formulas with these variants will be
                    rejected by characteristic 4. But because in this example the prepositions
                    are in rhyming position, characteristic 5 must be applied. This
                    characteristic claims that the word class of variants in rhyming position
                    is not important.
```

III.b FOUR TYPES OF THE ‘OBS’-FORMULA, CONCERNING CHARACTERISTICS 8, 9, 10 AND 11

In comb-formulas (two) type-2 variants are combined into one text-genealogical formula. It is also possible to derive text-genealogical information from other textual elements than two competitive variants, as is expressed by characteristic 8 (concerning word order), 9 (concerning rhyming conventions), 10 (concerning inversion of verses) and 11 (concerning interpolation or omission of words or verses). On the basis of these four characteristics the computer can build four types of formulas. These formulas cannot be called comb-formulas, because in these formulas no competitive variants are combined. Therefore, I call them obs-formulas, in which ‘obs’ is the shorthand for ‘observation’, expressing text-genealogical observations beyond the level of two competitive variants.

In general, an **obs-formula** contains the **element ‘obs’** followed by the number of the observation ‘01’, ‘02’, etc., and possibly preceded by a ‘?’ (to express doubts; further research is necessary) or a ‘^’ (to express that the observation does not offer text-genealogically information to build a historical text tree with). This ‘obs’-element (e.g. ‘obs01’, ‘?obs02’, ‘^obs01’) is printed at the start of the formula, right after the verse number of base text 02 and the number of texts concerned. Observations concerning characteristic 9 (on obeying rhyming conventions) are part of comb-formulas, and, therefore, not recognizable by the ‘obs’-element. Furthermore, the formulas in which observations concerning characteristic 11a (addition or omission of words) are express have the **element ‘^treat’** instead of the obs-element.

Normally, I am only interested in type-2 variations. However, a first run of the software learned that the type-2 observations concerning concerning characteristics 8 to 11 are not superfluous. Therefore, I decided to print out **detected type-1 variations** as well, to enable further study of these characteristics later on.
Below I will discuss the four types of the ‘obs’-formula.

III.b.1 The first type of the obs-formula, concerning characteristic 8 on word order

Characteristic 8 expresses that a difference in a syntactically adequate **word order** has to be has to be considered as a genealogical variation, as long as the difference in word order does not merely concern a different placement of an adverb in a verse or sentence. When I presented this characteristic, I remarked that I had doubts about the correctness of this

characteristic. Hopefully, the later evaluation of the characteristics will learn whether these doubts are appropriate.

The procedure to detect changes in word order is, in a nutshell, as follows. Suppose that we have (french) texts that have the following synoptic verses (in shorthand notation):

1.002 artus li bans ras de bretengn
2.002 li bons ras artus de bretegn
3.002 artus li bons ras de bretegn
4.002 artus li bons ras de bretengn
5.002 li bons ras artus de bretegn
6.002 artus li bans ras de bretagn
7.002 li bons ras artus de bretegn

First, the computer labels all the words of text 1 as numbers: ‘1=artus’, ‘2=li’, ‘3=bans’, ‘4=ras’, ‘5=de’, ‘6=bretengn’. Then the verse of text 2 is treated. The words in this verse get the same number codes as the words of text 1. Words which occur in text 2, but do not occur in text one are numbered as ‘x’: ‘2=li’, ‘x=bons’, ‘4=ras’, ‘1=artus’ ‘5=de’ ‘x=bretegn’. The word sequence of text 1 looks like 1-2-3-4-5-6. The one of text 2 is 2-x-4-1-5-x. The one of text 3 is 1-2-x-4-5-x. Notice that in the left-to-right word sequence of text 1 the numbers are increasing. When this increasing sequence is disturbed in one or more other texts, it is likely that we have detected a change in word order. It will be clear that this approach is not optimal when a word occurs more than once in a verse. Therefore, when a certain word occurs twice in a verse, I let the computer add a ‘2’ at the end of the second word (in the computer memory; not in the real shorthand text); the result is that both words become different words. Analogically a ‘3’ can be added at the end of a word.

By the way, these added numbers are not visible in the synoptic text and the shorthand text. But they can be observed in variation formulas like:

02.0345 07 ^comb.: 06-07-08-|01-02-05-10-="sprag"|"di3" (^:W2=Mx;4b-)

‘di3’ means: the third word ‘di’ (shorthand for, e.g., ‘die’; it belongs to the Mixed Category word type of thesaurus) in the verse. Unfortunately, the adding of numbers to a word does not work optimal. Generally, my software works with the thought that a verse contains unique words. By adding unique numbers to words that occur more than once in a verse, this thought remains correct. It is, however, possible that for instance all the 14 verses have the shorthand word ‘di’ as the fifth word; when two of these verses have as first word ‘di’, where the other texts have ‘de’, the fifth word in both verses will become ‘di2’. In that case, the software will detect a variation ‘di2’ versus ‘di’, which actually is not present. I consider this to be a rather harmless bug in my software: words that occur twice or more in a sentence, will seldom belong to the substantive and verb categories I am interested in. For the detection of differences in word order this bug can cause more problems. Since differences in word order will often concern more than two words, it does not have to be a harmful error.

For the moment, the computer only compares the word order of the base text (text version 02) with the word orders in the other texts. When, for instance, texts 06, 07 and 08 have words which are not present in text 02, but which do occur in texts 09 to 14, but in another word order, this difference in word order will not be detected. If the current (limited) word order observation are ‘promising’, i.e. text genealogically informative, we can decide to enhance the word order function in the software (and correct the mentioned bug).

Concrete examples of the obs-formula concerning word order (characteristic 8)

```
a. 02.0042 13 ?obs01: 01-02-06-07-08-|04-05-09-10-11-12-13-14-: W.O "kosten"-"sal" (T2);8;
      Interpretation: The computer/software does a first observation (= 'obs01') concerning a
                      difference in word order (= 'W.O') in 13 (= '13') texts near verse 42 of
                      base text 02 (= '02.0042'). The difference concerns the order of the words
                      'kosten' and 'sal' (= '"kosten"-"sal"'). In texts 01, 02, 06, 07 and 08
                      (= '01-02-06-07-08-') the order of these words is that 'kosten' comes
                      before 'sal' (in other words, the order of the words is as mentioned at
                      the end of the obs-formula rule). In the other texts 04, 05, 09 to 14 (=
                      '04-05-09-10-11-12-13-14-') the order of words is just the opposite: in
                      these 8 texts 'sal' comes before 'kosten'. Because each of the text groups
                      has two or more members, the formula '01-02-06-07-08-|04-05-09-10-11-12-
                      13-14-' is a type-2 variation formula. The fact that this is a type-2
                      formula is expressed by '(T2)'. ';8' expresses that this observation
                      concerns characteristic 8. As has been expressed above, I have doubts
                      whether we can use observations on word order as (text-genealogical)
                      building tools for genealogical trees. Therefore, I, or better, the
                      computer, added a question mark before 'obs01': '?obs01'.
b. 02.0017 10 ^obs01: 02-04-05-09-10-|01-11-12-13-14-: W.O "spreken"-"altos" (T2);8;
                      (^:W1or2=Av;8)
             Comment: This type-2 observation concerns the order of the (shorthand) words
                      'spreken' and 'altos'. Because one of both words (= 'W1or2') is labelled
                      as an adverb (= '=Av'), namely 'altos', the observation is rejected.
                      (= '^obs').
c. 02.0025 05 ^obs01: 01-|02-06-07-08-: W.O "si"-"sal" (T1);8;
             Comment: This observation on word order is rejected, because it concerns a type-1
                      variation: a variation concerning a type-2 group of texts with two or more
                      members (in this case four member texts: 02, 06, 07 and 08) verses a type-1
                      group consisting of one member (in this case text 01).
d. 02.0016 10 ^obs01: 01-|02-04-05-09-10-11-12-13-14-: W.O "gelaten"-"nit" (T1);8; (^:W1or2=Av;8)
             Comment: This observation on word order is rejected for two reasons: first of all
                      it concerns a type-1 variation; second, one of both words concerned, in
                      this case 'nit' (the shorthand version of 'niet') is an adverb.
```

III.b.2 The second type of the obs-formula (in combination with the comb-formula), concerning characteristic 9a and 9b on obeying rhyming conventions

Characteristic 9 expresses that when the variants are part of rhyming texts and they are in rhyming position, they have to **obey rhyming conventions**. This characteristic speaks of variants: we can ask ourselves whether this characteristic should have been treated in III.a near the comb- formulas. In fact, we already came to speak about characteristic 9 in III.a.5, while discussing the comb-formula with a characteristic 5 element in it. However, characteristic 9 does not concern the rhyming of the two variants mentioned in a type-2 variation formula. It concerns the fact that one or both variants do not rhyme optimally with the next or previous verse. This violation of pure rhyming conventions is observed at a very early stage, while building a synoptic text out of the fourteen *Lanseloet van Denemerken* texts, long before the computer starts analysing variants. At that early stage, of each text the verse numbers are saved of the verses that do not rhyme optimally. Later on, when the computer starts building type-2 variation formulas, these verse numbers are used again.

Concrete examples of the obs/comb-formula concerning characteristic 9a and 9b

```
Characteristic 9a
a. 02.0051    ?obs01: conventions pure rhyme violated in pair (~gelike - ~geboren) of text 05-
                      (near 02.51);T1?;9a
             Comment: The computer has detected during step 1, the process in which the
                      synoptic text has been produced, that the final words 'gelike' of text
                      05, near verse 51 of base text 02, and 'geboren' of the next verse of
                      text 05 do not rhyme. This early step 1 detection is repeated here. Since
                      only text 05 is involved, this detection may lead to a type-1 variation
                      formula. The question marks denote that I do not know precisely how to
                      deal with this information text-genealogically.
b. 02.0261    ?obs01: conventions pure rhyme violated in pair (~komen - ~jan) of texts
                      09-10-11-12-13-14 (near 02.261);T2?;9a
             Comment: The same comment can be given here, except that now not one texts but
                      five texts are involved, which therefore has a type-2 character.
c. 02.0010    ?obs02: conventions pure rhyme violated in pair (~besessen - ~verwissen) of text
                      08- (near 02.10);T1?;vowels;9a
             Comment: In Appendix A this rule is discussed near verse 02.10. The computer has
                      detected during the performance of the very first step that 'besessen'
                      and 'verwissen' do not rhyme. Now is detected that the violation of
                      rhyme consist of differences between the vowels 'e' and 'i', which is a
                      rather small differences. One may even claim that 'besessen' and
```

```
                    'verwissen' do rhyme a bit.
d. 02.0081    ?obs01: conventions pure rhyme violated in pair (~huden - ~besgawden) of texts
                    06-07-08- (near 02.81);T2?;vowels;9a
             Comment: The same comment goes here as well. Notice that now three texts are
                    involved (and therefore it is a T2 environment: 'T2'), while in the
                    previous example only one text ('T1') was involved.
e. 02.0449 11 ^comb.: 06-07-|01-02-05-09-10-11-12-13-14-="~besugen"|"~besuren" (wds r.p;5)
                    (conventions pure rhyme violated;9a)
             Comment: First, the computer has detected that the combination of the variants
                    '~besugen' and '~besuren' (both in rhyming position, as is expressed by
                    the tilde '~') leads to a good comb-formula. However, the computer knows
                    from observation '02.0449 ?obs01: conventions pure rhyme violated in pair
                    (~besugen - ~aventuren) of texts 06-07- (near 02.449);T2?;9a' that
                    '~besugen' and/or '~besuren' do not rhyme optimally with the next verse.
                    Therefore, the computer rejects the combination of the variants: '^comb.'
f. 02.0129 11 ^comb.: 02-08-14-|01-05-06-07-09-11-12-13-="~brengen"|"~bringen" (<:e|1vow.;7b)
                    (wds r.p;5) (conventions pure rhyme violated;9a)
             Comment: This variation (formula) demonstrates that characteristic 9 also works in
                    combination with other characteristics, like characteristics 6 and 7.
```

```
Characteristic 9b
a. 02.0077    ?obs01: the pair (~here - ~here) of text 14- near 02.77 consists of duplicate
                    words;T1?;9b
             Comment: This observation derives from the very first step the software performs,
                    in which the development of the synoptic text is started. It is detected
                    that in one text ('T1'), text 14, near base verse 02.77, two verses end
                    with the same rhyming words: this is a violation of normal rhyming
                    conventions; evidently, one of both words must be incorrect. We must be
                    careful in dealing with this observation, as is marked by the question
                    mark, which expresses 'doubts': when one of the words can be easily
                    repaired (for instance by changing 'here' in 'ere', because we know that
                    people if the Dutch province Zeeland and in Flanders, sometimes tend to
                    add or delete an 'h' at the beginning of a word).
b. 02.0212    ?obs01: the pair (~gesgin - ~gesgin) of texts 07-08- near 02.212 consists of
                    duplicate words;T2?;9b
             Comment: This observation demonstrates that duplicate rhyming words will also be
                    detected when standing in type-2 ('T2') environment.
```

III.b.3 The third type of the obs-formula, concerning characteristic 10 on inversion of verses

Characteristic 10 expresses that the **inversion** of (rhyming words of) verses is genealogically informative when these verses fit well in the text. Notice that the element 'fit well' can imply a judgement of the philologist. For characteristic 10 goes the same as for characteristic 9: it is observed during the early stage when the computer is building the synoptic text.

```
Concrete examples of the obs-formula concerning characteristic 10
```

```
a. 02.0746 11  obs01: 09-10-11-12-13-|02-04-05-06-07-08-: rhyming pair (~sandrin - ~guldin) of
                    text 02 (near 02.746) is inverted in texts 09-10-12-12-13- (T2);10
             Comment: This formula tells us that near verses 746 and 747 (of text 02) the order
                    of the rhyming words is 'guldin' before 'sandrin' in texts 09, 10, 11, 12,
                    and 13, while this order is inverted in texts 01, 02, 04, 05, 06, 07 and
                    08. (In variation formulas no information is offered on the 'originality'
                    of one of the variants; logically, when I say that in the formula an order
                    of verses is inverted, I do not intend to say that one of both orders is
                    original.) Because both '09-10-11-12-13' and '02-04-05-06-07-08-' are
                    groups with two or more texts, the formula is a type-2 variation formula,
                    as is expressed by '(T2)'. Notice that this observation is not optimal,
                    because 'sanderin' of text 01 is not incorporated in it.
                    Later on, in Appendix D, §10.1, this observation will be transformed into
                    the more adequate formula: '02.0746 12  obs01: 09-10-11-12-13-|01-02-04-
                    05-06-07-08-: rhyming pair (~sandrin - ~guldin) of text 02 (near 02.746)
                    is inverted in texts 09-10-12-12-13- (T2);10'
b. 02.0020 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-: rhyming pair (~min - ~sin) of
                    text 02 (near 02.20) is inverted in text 01 (T1);10
             Comment: This formula concerns a type-1 variation formula (= '(T1)'). Type-1
                    variation formulas are not used for the development of a genealogical
                    tree. Therefore, the not-sign '^' is placed in front of 'obs01'. This
                    observation formula is also discussed in Appendix A, in which amongst
                    others the verses and formulas near verse 02.20 are presented.
```

III.b.4 The fourth type of the obs-formula, concerning characteristic 11

Characteristic 11 expresses that the **addition** (or interpolation) and **omission** of **words** (= characteristic 11a) or complete **verses** (= characteristic 11b) is genealogically informative when these words or verses fit well or offer no crucial information. Notice that it is the philologist has to determine the genealogical importance, because he has to judge whether the words/verses fit well or offer no crucial information. Notice also, that when we are building a chain, i.e. the base form of a stemma, it is not not important to know whether a word/variant or verse has been deleted or added. The computer can detect, for instance, that one or more texts have two or more verses, where the base text has a single verse. This observation can be explained in two ways: 1. it is possible that in the base text one verse has been deleted, or 2. it is possible that in the other texts one verse has been added.

III.b.4.1 Information concerning characteristic 11a

The detection of characteristic 11a, concerning added or missing words, is complex, because in that case one word/variant is observable, while the other absent word is not observable. It is not possible for the computer to say that a certain word is a variant with an empty variation place. All the computer can do is the following. First, it observes all kinds of type-2 variants, groups of words occurring in more than two texts. These type-2 groups are put on a 'list of of type-2 variants'. Second, the computer will combine the type-2 variants into type-2 variation formulas. When two variants are combined into an acceptable ('comb') variation formula, both variants are scratched off the 'list of type-2 variants'.

The question is how we can determine when a variant can be scratched off that list. I taught the computer two 'scratching' rules. The **first 'scratching' rule** is that when in a variation formula is expressed that two variants differ a bit (expressed with a question mark '?' or the small difference mark '<'), or when both variants are in rhyming position (characteristic 5), both variants can be scratched off the list. When this first rule cannot be applied, the second rule will be applied. The **second 'scratching' rule** is that when in a variation formula is expressed that two variants belong to the same word categories (expressed by ';4b+') they may be scratched of the list of type-2 variants; when they belong to different word categories (expressed by ';4b-'), these two variants may not be scratched off the list; however, when one of the variants belongs to the Mixed word category, both variants may be scratched off the list (except when one of the variants belongs to the word category I have my doubts about: the Adjectives).

The theory suggests that we must be careful in using small added or deleted words as carriers of text-genealogical information. To enable evaluation of this suggestion I ordered the computer to measure the length in characters of a potentially added word. Furthermore, I told the computer that a small word is a word with three or fewer characters. Let us study now the next example, near the 9th verse of base text 02.

02.9 dat ik di sgone sandrin
01.47 dat ik di sgone sanderin
05.9 dat ik di over sgone sandrin
06.10 dat ig di sgone sandrin
07.10 dat ig di sgone sandrin
08.10 dat ig di sgone sandrin
09.9 dat ik di over sgone sandrin
10.15 dat ik di over sgone sandrin
11.14 dat ik di over sgone sandrin
12.16 dat ik di over sgone sandrin

13.16 dat ik di over sgone sandrin
03*
04.11 dat ik di over sgone sandrin
14.4 dat ik di over sgone sanderin

First, the computer builds the ‘list of type-2 variants’:
- ‘ik’ in 01-02-04-05-09-10-11-12-13-14-
- ‘ig’ in 06-07-08-
- ‘over’ in 05-09-10-11-12-13-14-
- ‘~sandrin’ (the ‘~’ denotes its rhyming position) in 02-04-05-06-07-08-09-10-11-12-13-
- ‘~sanderin’ in 01-14-

Second, the computer starts combining the type-2 variants into formulas:
02.0009 13 ^comb.: 06-07-08-|01-02-04-05-09-10-11-12-13-14-="ig"|"ik" (<:GD g|k;7c)
(^:W1=Pn;W2=Pn;4a+;4b-)
02.0009 13 ^comb.: 01-14-|02-04-05-06-07-08-09-10-11-12-13-="~sanderin"|"~sandrin"
(<:e;?;6a) (wds r.p;5) (^:names with > prox. 0.93;7d)

Third, in order to scratch off variants of the list of type-2 variants, the computer studies these variation formulas. (None of both formulas can be used for text-genealogical purposes, as ‘^comb’ tells us: ‘ig’ and ‘ik’ are competitive variants, but they are useless for the development of a text-genealogical tree as is explained by characteristic 7c; the same goes for ‘~sanderin’ and ‘~sandrin’, rejected because of characteristic 6a and/or 7d.) The computer detects in the ‘ig’/‘ik’-variation formula ‘<:’, expressing that the difference between the variants is small. Therefore both ‘ig’ and ‘ik’ are scratched off the list. For same reason ‘~sanderin’ and ‘~sandrin’ are removed from that list. The result is that ‘over’ is left in the list. This variant is not treated in a variation formula. Therefore, finally, the computer will report us now the following observation:
02.0009 13 ^treat: 4ch.wrd "over" (Pp) in 04-05-09-10-11-12-13-14- (rest: 01-02-06-07-08-);11a?
This rule must be interpreted as follows: the four character word ‘over’ (= ‘4ch.wrd "over"’), a preposition (= ‘(Pp)’), occurring near verse 9 of base text 02 (= ‘02.0009’) in texts 04, 05, 09, 10, 11, 12, 13 and 14 (= ‘in 04-05-09-10-11-12-13-14-’), is not treated (= ‘^treat’) in any type-2 variation formula in which it stands as a variant across another variant; maybe the word ‘over’ is an added/omitted word that does occur in texts 05, 09, 10, 11, 12, 13 and 14, but is absent in the other texts in which the verses have a contents (= ‘(rest: 01-02-06-07-08-)’); therefore, maybe the word ‘over’ is an added or omitted word as is expressed by characteristic 11a (= ‘;11a?’).

Most of the time, the absence of a word will be detected by the computer indirectly: then the word, which is present in certain texts will be reported as not treated (‘^treat’). Sometimes, exceptionally, the computer will not report anything about the absence of a word. This can happen when complex variations (i.e. variations with three or more variants) occur, and two true groups of text versions have two variants of a word, while no competitive variant is present in one or more other texts.

Consider, e.g. the verses near 02.424: the pronoun ‘he’ is present in texts 06, 07 and 08; the same pronoun, spelled as ‘hi’, is present in texts 02, 04, 05, 09 and 10; no pronoun is present in texts 11, 12 and 13. Because the pronoun has vanished in these three texts, the three verses are not grammatically adequate. Possibly, this grammatical inadequacy would have been detected when we could have used a grammatical parser to analyze the syntactic

structure of the verses. The computer will create the next variation formula:
02.0294 08 ^comb.: 06-07-08-|02-04-05-09-10-="he"|"hi" (<:e|1vow.;7b) (^:W1=Pn;
W2=Pn;4a+;4b-)
and will have no reason to mention a ^treat-remark concerning this pronoun. At the moment, I did not find a solution for this problem. Evidently, one solution would be to use a grammatical parser.

Some other examples concerning characteristic 11a:

a. 02.0058 13 ^treat: 6ch.wrd "mogtet" in 02-04-05-06-07-08-09-10-11-12-13- (rest: 01-14-) (T3 or T2?);11a?
Comment: The computer has detected that the 6 character word ‘mogtet’ (of course in shorthand notation), occurring in 11 texts, is not treated in any variation formula. This word does not appear in texts 01 and 14. There are two possibilities. The first possibility is that the word ‘mogtet’ is absent in both texts 01 and 14; this leads to a type-2 formula 01-14-|02-04-05-06-07-08-09-10-11-12-13-14 (in which texts 14 have ‘empty’ words; admittedly, it is not our purpose to build variation formulas with variants that have empty variation places). The other possibility is that text 01 has a unique variant ‘x’ (because it is unique, and therefore it is a type-1 variant, it is not present in the list with type-2 variants) and text 14 also has a unique variant ‘y’ (a type-1 variant as well). Then, a type-3 variation formula can possibly be built with the variants:
01|14|02-04-05-06-07-08-09-10-11-12-13-. A type-3 variation formula, with one type-2 group with two or more members, and with two or more type-1 groups (each with one text as a member), is unimportant for text- genealogical research. In other words, when in two texts a variant is missing which is present in all the other (two or more) texts, this is covered by a text-genealogically unimportant type-3 variation formula or by a kind of type-2 formula. This is the meaning of the element ‘(T3 or T2?)’ in the formula of this example.

b. 02.0058 13 ^treat: 2ch.wrd "so2" (Av) in 02-04-05-06-07-08- (rest: 01-09-10-11-12-13-14-); (^:small word?);11a?
Comment: As is explained above (§III.a.1, point 4), ‘so2’ stands for the second occurrence of the word ‘so’, labelled in the thesaurus as an adverb, in a verse. The computer has detected that this word, considered to be a small word because it has three or fewer characters, is available in texts 02, 04 to 08, while it is missing in texts 01, 09 to 14. The theory says that we must be careful in using small added words as text-genealogical informants.

c. 02.0058 13 ^treat: 5ch.wrd "wesen" in 04-06-07-08-09-10-11-12-13-14- (rest: 01-02-05-);11a?
Comment: The computer has detected that the 5 character word ‘wesen’ occurs in texts 04, and 06 to 14 (a type-2 group with 10 members) has not been treated by any variation formula so far and that the word does not occur in texts 01, 02 and 05 (a type-2 group with 3 members); text 03 has no text in this case.

III.b.4.2 Information concerning characteristic 11b

Added or missing verses, characteristic 11b, are detected early, long before the comparison of variants, when the computer compares the rhyming words of the texts in order to build a synoptic text. Of course the detection of extra and missing verses is dependent on the choice

of the base text. As we now, all the verses of other texts are compared with one verse of the base text. When the other texts have more than one verse, these extra verses are not compared with each other, since the comparison starts with the base text, which does not show an extra verse. The philologist must compare these extra verses, to search for genealogically informative variants. (This manual comparison could have been automated as well, by taking a text with the extra verses as the base text instead of text 02.) Some examples of variation formulas with characteristic 11b:

a. 02.0082 12 obs01: 11-12-13-14-|01-02-05-06-07-08-09-10-: TWO or more rules (T2);11b; philologist...
   Interpretation: Near verse 02.0082 the texts 11, 12, 13 and 14 have two or more rules/ verses, while texts 01, 02, 05 to 10 have a single verse. The philologist has to investigate whether these extra verses/rules fit well or offer no crucial information. Furthermore he must determine whether these extra verses contain test-genealogically informative variants. The group of texts with the extra verses is a type-2 group (with more than one member); the group with a single verse or rule is a type-2 group as well; therefore, we can say that the variation formula that expresses how the texts with extra verses are grouped against the other texts is type-2 variation formula.
b. 02.0072 12 ^obs01: 01-|02-05-06-07-08-09-10-11-12-13-14-: TWO or more rules (T1);11b
   Comment: It is observed by the computer that only text 01 shows two or more rules. The result is a type-1 variation formula, that does not contain information with which we can build a genealogical tree. Therefore, the observation is rejected: '^obs01'.
c. 02.0159 11 obs01: 01-05-06-07-08-09-10-11-12-13-|02-: TWO or more rules (type-1; interesting);11b; philologist...
   Comment: One text, text 02, contains a single verse, while all the other texts (in this case texts 03 and 04 have no text) contain two or more verses. The variation formula is therefore a type-1 variation formula. We cannot use such (type-1) formula for the development of the basis shape text-historical tree. However, it is possible that the text group with texts 01, 05, etc., contain text-genealogical variants. As expressed before, the computer does not examine the extra rules. It is up to the philologist to do so. Notice that in a regular type-1 or type-2 formula, the smallest group is printed first, before the larger group. But in the case of extra verses/ rules, I wanted to let the formula express that the first group mentioned is the group that contains the extra verses/rules. Notice, furthermore, that it would possibly have been better to put a question mark before 'obs01'.
d. 02.0039 13 obs01: 09-11-12-13-14-|01-02-04-05-06-07-08-10-: first group (T2) have NO TEXT; 11b; philologist...
   Comment: A formula that expresses that a group of texts is detected, looks much like a formula that expresses that the detection of a group of texts with extra verses. Therefore, I hope that the interpretation of example formula d does not lead to interpretation problems. In the formula is expressed that in texts 09, 11, 12, 13 and 14 (a type-2 group) a verse is missing, while texts 01, 02, 04, 05, 06, 07, 08, 10 (also a type-2 group) do have a verse. The philologist has to determine whether this observation is text-genealogically informative, by answering the question whether the absence of the verses is striking to the eye or whether the verses fit well.

APPENDIX C: The Computer Results: the Synoptic *Lanseloet van Denemerken* Text Versions and the Variation Formulas
